After the Gliding Competition at Itford Hill in 1922, out of which sprang the light aeroplane movement, which has resulted in the production of many hundreds of excellent aircraft which are nothing in the least like light aeroplanes as people originally thought of them, all interest in gliding ceased for several years. But in the last six months quite a remarkable amount of correspondence on the subject has reached this office.

People have written asking where they can buy gliders or where they can buy designs from which they can build their own gliders, or where they can get information on the subject of gliding. And the other day a letter came in from a sportsman at Wolverhampton, who describes himself as late R.F.C. and R.A.F., saying that he wants to get in touch with an organisation, club, or journal whose primary object is the encouragement of motorless flight in heavier-than-air machines. He adds that at the same time he would be glad to know whether there are any firms in this country who manufacture gliders or who have had experience of their manufacture in the past. And the best one could do was to give him addresses in Germany.

Obviously, therefore, the time has come for something to be done about this business in this country. So a few points of interest on the subject are offered herewith to readers.

Gliding for Sport.

In the first place, gliding must be clearly divided into two categories. The first is gliding for sport. The second is gliding for purposes of scientific research. And the two can be combined, just as sport and research can be combined in a great many lines.

Even the most innocent forms of research can entail quite dangerous sports. For example, the serious entomologist who goes bug-hunting in the jungle stands quite a sporting chance of being eaten by a lion or tiger, swallowed by a python or a boa-constrictor, or trodden upon by an elephant. And, after all, he is often merely a butterfly-hunter.

Similarly, the scientific meteorologist or geologist who climbs high mountains in search of knowledge takes on the same risks as those people who go in for futile mountain climbing as a sport, or break themselves winter-sporting. And in just the same way all the sport and risk of gliding for fun can be had by the serious student of aerodynamics.

Gliding for sport is probably just as exhilarating and just as good fun and just as futile in the end as is any other kind of sport. But, like all other sports, even though it is futile, it has excellent moral and physical effects. It gives its followers plenty of fresh air and exercise. And it breeds in them a healthy spirit of competition and sportsmanship.

In its most futile form gliding is like toboganning, or lugeing, or bobbing. The game is best summed up in the words of the Chinese laundry-man in Canada who saw toboganning for the first time and described it as "Goee-like-Hell, walkee-back three-mile." But, even so, the slide downhill is exhilarating, and towing or carrying the glider back is magnificent exercise.

Of course, nobody who glides for sport will mechanise the game as did Mr. Anthony Fokker at Itford, when he arrived with a large American car rigged up with a kind of cradle on top cleverly designed to fit his glider. When he had done his glide and had alighted at the bottom of the hill, three miles or so away, his crew simply used to drive the car down the road to the nearest possible point to his landing, where they clipped the glider onto its cradle and drove back again.

Your true gliding sportsman will always man-handle his glider back to its starting-point, subject to two alternatives: (A) that a first-class gliding pilot, given enough wind, may stop in the air until everybody is bored stiff with him, and may then alight on the point from which

"THIS QUIET SAIL IS AS A NOISELESS WING TO WAFT ME FROM DISTRACTION."

(Byron—*Childe Harold's Pilgrimage.*)

he started; or, (B), he may glide along his pet range of hills and come down miles and miles away, so that the glider has to be taken to pieces and brought back by road with the help of a friendly automobile. Either way, the game is very good fun.

As the accompanying photographs show, gliding is one of the national sports of Germany. There is a permanent camp of gliding enthusiasts in the Rhoen Mountains at a place called Rositten. In the Summer it is full of sportsmen and sportswomen, young and old, who spend their holidays there. In the Winter, the more enthusiastic still live there and glide in the Winter winds, thus gaining definite scientific information about the effects of temperature and wind-speeds on one another.

SCIENTIFIC RESEARCH.

The scientific side of gliding is another matter altogether, though it works in with the sporting side. There is certain knowledge to be got from gliding experiments about wing-forms and fuselage-forms, and combinations of the two, which one believes cannot be got in any other way.

In all countries aircraft designers depend for such information on wind-tunnel experiments. They make models of aircraft, large and small, they put them in a tunnel, mounted on delicate measuring apparatus, and they either blow or suck a draught through the tunnel, and measure the effect of that draught on their models. Sometimes the results are highly informative. Sometimes they are highly misleading.

Like all scientific researchers, wind-tunnel experts are liable to be misled because they are so busy looking for one particular result that they forget how surrounding conditions may affect that result. And, if they remember, they have no accurate way of correcting their results.

The air in wind-tunnels becomes turbulent because some of it sticks to the sides of the tunnel and the rest rolls and curls over it—air being rather stickier than treacle. Also, the supports by which models are attached to the measuring instruments interfere with the true reading of those instruments.

Competent experimenters do make allowance for these interferences, but in the end the knowledge gained is never quite the same thing as that which can be got from full-scale experiments in the open air. The air-waves caused by the turbulence inside the tunnel are never on the same scale in proportion to the size of the models as are the waves caused by the internal working of free air, any more than the effect of the waves in an experimental tank, as used by designers of ships, are in proportion to the waves in the open sea.

When an aeroplane is built from wind-tunnel results, and the engine is put therein, it may be a good aeroplane or

UNIQUE
British Triumph!
for Air, Land and Sea!

Air — 1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163 4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192.4 m.p.h.

1926 The first non-stop crossing of South Atlantic Ocean carried out by Commandante Franco flying a Dornier flying-boat with two Napier engines.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281.669 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

Land—1929 The highest speed ever attained on land was made by Major Sir Henry Segrave when he drove his Irving-Napier car over one mile at the amazing speed of 231.36 m.p.h.
Capt. Malcolm Campbell set up world's land speed records at Verneuk Pan with his Napier Arrol-Aster as follows :—over 5 miles, speed 211 m.p.h.; over 5 kilometres, speed 216.53 m.p.h. They both used Napier engines

Water—1929 The world's motor-boat speed championship was won at Miami by Major Sir Henry Segrave, driving Sir Charles Wakefield's Napier-engined "Miss England."
Sir Henry Segrave at the Lido with the same boat made six runs over the measured mile, averaging a speed of 92.8 m.p.h.
At this meeting, competing against the best from Italy and America, Sir Henry Segrave won all trophies, including the Duke of Piedmont's cup and Count Volpi's cup.

LAUNCHED.—The famous glider pilot Wolf Hirth. The launching cable is just dropping off the machine. In the foreground may be seen observers with range-finders watching the competitors.

it may be a bad aeroplane, but little can be learned from it about the thing which aeroplane designers most want to know,—that is the actual efficiency of their aeroplane. The engine and the air-screw interfere with just exactly the air currents that they most want to study, which are those round the body and nose of the machine, and round the junctions of the wings and the body.

Also, thanks largely to the effect of the War 1914-18, we have engines of such power that our ideas of real economy in power have become altogether distorted. Quite obviously even our very best aeroplanes use far too much power in pushing or dragging themselves through the air.

The Modern Aeroplane.

Considered as a glider, the best aeroplane in the World to-day is a contemptible apparatus. People go and stick windmills for dynamos, and bomb-racks, and guns, and things all over it, and even strap spare wheels, and spare air-screws, and suit-cases, outside it, without doing much harm to its performance, because the whole thing is so bad, when considered beside the ideal streamlined shape for that speed and power, that a few obstructions more or less do not matter.

Conversely, considered as a high-speed vehicle, a bird is a contemptible apparatus.

Few aeroplanes have a better gliding angle than 1 in 10, and only a few are as good as that. On the other hand, few birds have a speed of more than 30 miles an hour, and most of them are considerably slower. But somewhere between the two there ought to be a flying machine which is both a really good glider and a high-speed vehicle. And systematic gliding experiments may help very considerably in discovering such a machine.

Many a time pilots have described aeroplanes which they disliked as having the gliding angle of a brick. A correspondent in Canada described an American machine the other day as "landing like a gliding paving-stone." Compared with a bird, those descriptions might well describe the gliding angle of even the best aeroplane, for not much power is needed to heave a brick along a path of 1 in 10.

Just what the gliding angle of a really good bird is nobody knows, because there is never an opportunity of seeing a bird glide at its best angle in absolutely calm air. And if there is any wind blowing at all, a bird uses instinctively every curl in the air for his support.

The small birds which flap their wings vigorously cannot be considered as gliding birds, but the real gliding birds, of which the gull is probably the worst and the albatross is probably the best, certainly have a wonderfully good gliding angle.

False Reasoning.

Many of the early students of bird flight, among them Dr. Hankin who studied the gliding of birds for many years in India, got into their heads the idea that birds possess some strange power unknown to us of keeping themselves up in the air without an upcurrent. But when one read a good deal on this subject in the early days of flying, about twenty years ago, one came definitely to the conclusion that all the examples quoted by Dr. Hankin, and his supporters, of birds ascending without flapping their wings in a flat calm and so forth, were merely due to misunderstanding the conditions. In every case there was a perfectly good reason why there should be an upcurrent.

One of the most careful and intelligent students of bird-flight was the late Dr. Chanute, a very great railway engineer, who made the study of flying his hobby. He was the man who really taught the Wright Brothers to fly, and actually paid for a good deal of their early work.

In one of his observations he noticed a turkey-buzzard ascending steadily in spirals, on a flat calm day, without flapping his wings at all. Then he noticed a feather fall off the bird and come down slowly, although the bird was steadily rising. Apparently he took this at first as being evidence of the absence of an upcurrent, arguing that if

READY TO START.—Robert Kronfeld just before getting off on his record-breaking flight on July 20, in which he reached a height of 2,000 metres and covered over 150 kilometres. The attachment of the launching-cables should be noted.

there had been any upcurrent at all, the feather, being so light, would not have descended.

One of the earliest students of flying in America, Mr. Victor Lougheed, read this incident in Dr. Chanute's writings at the time, and, being a practical engineer, tried out an experiment of his own. He happened to be stopping in a hotel at the time, so he extracted a feather from one of the hotel pillows, dropped it out of the window, and timed it with a stop-watch till it alighted in the street. The air was flat calm at the time, and, calculating from the height of his window and the time of the descent, he figured out that the feather fell at the rate of 10 feet a second.

Now, if that turkey-buzzard had a gliding angle which made the vertical component of his descent—or, as it is now generally called in America his "sinking speed"—say 5 feet a second, and if there happened to be an up-current at that point of 8 feet a second, then obviously the bird would go up 3 feet and the feather would fall 2 feet a second. And the perfect aeroplane ought to be something like that.

PROGRESS.

The elementary gliders which we had at the Itford Competition in 1922 were able to keep up for hours on the upcurrents caused by a fairly strong out-of-season North wind blowing against the steep cup-faced slopes on the North side of the hill, which collected the wind and made a regular chimney of it.

They knew nothing of the advantages to be got from a big span and small chord (which we used to call "high aspect-ratio" and valued highly in the early days), nor what can be done with flexible trailing edges to the wings, which we used to have in early aeroplanes. Our overpowered extravagant war-machines have given our designers wrong ideas about a lot of things, and on none more than what is a reasonable price for aeroplanes and engines.

Since then the German gliding enthusiasts have produced gliders which will soar easily on the upcurrents caused by much lighter winds blowing against quite moderate slopes. So evidently a great deal of progress has been made by the German gliders.

On the other hand, nothing has been done in this country. So all our present aircraft designers are short of the scientific knowledge which might have been gained if we had gone on with our gliding experiments here.

Among the South Downs we have ideal gliding ground because slopes can be found over which soaring experiments can be made when there is a wind blowing, and down which useful experiments in discovering actual gliding angles can be made in a flat calm. If gliding experiments were made with a thorough understanding, so far as our present knowledge goes, of what we are trying to discover in the way of improving the efficiency of our aircraft, then they could be turned to good account.

THINGS TO BE LEARNED.

Mr. Victor Lougheed, to whom one has already referred, has some very interesting theories on the possibilities of gliding angles. His opinions are worth considering because he has been at the game a long time and is a practical engineer rather than a scientist. As a matter of fact, in 1909 he wrote a book called "Vehicles of the Air," which was not only the best thing that had been written on aircraft up to that time, but is to-day quite the most valuable work of reference on the doings of that epoch-making year.

Also, as a matter of general interest, one may add that he happens to be the elder brother of Mr. Lockheed of the Lockheed Hydraulic Brakes and of the other Mr. Lockheed who designed the Lockheed Vega, which one still holds is the most efficient aeroplane in the World. They spell their name differently simply so that people may know how to pronounce them and not call them Luffheed or Lowheed. And the brothers are a remarkably clever family of successful engineers, so Victor Lougheed's ideas are worth considering.

Mr. Lougheed started an argument on the subject of gliding-angles a few days ago by saying that the modern Pullman train, with roller-bearing axles, has a gliding angle

of 1 in 200. That is to say, if you put it on a slope of 1 in 200 and take off the brakes it will overcome its starting inertia and gather speed. In other words, if you started it on a mountain 5,280 feet high it would glide for 200 miles. As a matter of fact, it would really glide a good deal further, because when once it gathered way its inertia would probably keep it going at even a finer angle, or, at any rate, its inertia would carry it over a long flat stretch before starting on another downward slope.

Of course, a train does not have to support itself on its wings, and when you are talking about a gliding aircraft you have to allow for the fact that the wings of the machine have to carry the weight while the force of gravity pulling it down overcomes the head resistance. But Mr. Lougheed believes firmly that a really good gliding bird, say, like a turkey-buzzard or a hawk, probably has a gliding-angle as good as 1 in 250, and that the first-class gliders such as the albatross or the Andean condor may have gliding-angles as good as 1 in 500.

When you come to think of it, supposing that the condor really has a gliding-angle of 1 in 500, if he started off a mountain 10,000 feet high, and did not meet with any interference in the way of change of wind or down-currents, he could glide for 500 miles without flapping. So that is something up against our best aeroplanes, which from the same height would cover less than 20 miles with their engines stopped.

Towed Gliding.

Hitherto, in this essay on gliding one has considered it only as a sport or an art or a science which can only be performed or studied or operated with the help of a range of hills. But our friends in Germany have shown us that serious gliding experiments, especially in the study of gliding-angles and so forth, can be made with the help of an ordinary aeroplane.

Those of us who were at the Rotterdam Meeting saw Herr Espenlaub who was one of the earliest, and is certainly one of the most expert, of German gliders, towed in a glider to a height of several hundreds of feet, where he dropped his tow-rope and proceeded to glide down into the aerodrome.

The machine which towed him up was a miserable little thing with a tiny little two-cylinder engine which at first sight seemed unlikely to be able to lift itself. But so light is Herr Espenlaub's glider that even this little machine got off without much trouble, and climbed faster towing the glider than one would ever have expected it to climb alone. The same glider towed behind a fairly fast aeroplane would probably have had to be held down with the elevator to keep it from out-climbing the machine which was towing it.

This little demonstration showed clearly that for really scientific experiments, especially for experiments in a flat calm, which would be the most valuable of all, perfectly good glides can be made with a towed glider. And the attachment to which the tow-rope is made fast can itself work through a spring-balance which will give an exact measure of the draw-bar pull needed to tow the glider, and so something very like an exact measure of the head resistance of that particular type of aircraft at different speeds can be got.

A RECENT GERMAN GLIDER.—The "Lore" of the Wurtembergischen Luftfahrtverbandes piloted by Herr Wolf Hirth.

A FAMOUS GLIDING PILOT.—Edgar Dittmar by the tail of the "Schloss Mainberg."

The whole subject is full of interest, and, as has been said, it has been badly neglected in this country. In Germany, gliding is a national sport. In France, some quite interesting gliding experiments have been made during the past year or so. In America and in Australia a number of sportsmen are beginning to take a revived interest in what is, after all, the most elementary form of flying. And even in Soviet Russia a certain amount of gliding has been done.

Therefore one suggests that the time has now come when something ought to be done about it in this country. Consequently, if any readers of this paper want to be put in touch with other readers who have ideas on the subject, they are invited to write to the office of The Aeroplane, 175, Piccadilly, London, W.1, and mark their envelopes "Gliding."

Personally, one feels that this is a movement which is likely to grow very considerably, and so one does not undertake to do anything more than put these enthusiasts in touch with one another. After that, if they want to form a gliding association or anything of that kind, we shall be very pleased to publish notices about their doings in The Aeroplane.—C. G. G.

"AGE CANNOT WITHER . . ."

The late *Direction Générale de l'Aeronautique* (which has now been superseded by the *Ministère de l'Air*), before its passing, decreed that on and after Oct. 1, 1929, all aircraft built more than ten years ago should be regarded as obsolete and ineligible for a renewal of the French equivalent of an Airworthiness Certificate.

The *Ministère de l'Air* has not yet countermanded this decree, and the result is that a wholesale objection is now being raised. It is argued that if the *Bureau Véritas* is willing to certify and insure old aircraft as fit for flying, the Government, which has sold these old aircraft to unsubsidised companies, schools, flying associations, etc., has no right to deprive these bodies of their means of livelihood purely on a matter of age.

Digitized by Google

THE AERODROME CONFERENCE

The Conference convened by Sir Alan Cobham and Sir arles Wakefield was held in the Lecture Theatre of the stitution of Electrical Engineers on Nov. 5. Col. the aster of Sempill was in the Chair as Chairman of the yal Aeronautical Society.

With that personal modesty which is so typical of Sir arles Wakefield, the invitations to the Conference were tually sent out in the conjoined names of the Royal Aero-utical Society, the Royal Aero Club and the Air League of e British Empire, despite the fact that no one of those dies, nor the whole three combined, would ever have had ther the initiative or the intelligence or the driving power have imagined or to have organised or to have got to-ther such a gathering of the Municipal Authorities of reat Britain.

The whole idea from the beginning was the product of e brain of Sir Alan Cobham. It was probably healthily riticised by the sound common sense of Lady Cobham. It as submitted to and approved by Sir Charles Wakefield hose commercial genius saw the possibilities for success f the scheme as a whole and whose immense patriotism nd generosity prompted him, as he has done so often be-ore, to pay for the whole thing out of his own pocket. One loubts whether either of the august bodies whose names igured so large on the invitation cards paid for so much s a postage-stamp.

As has been said before Sir Charles paid for the tour on the piece-work principle, and if ever there was a man who could get value out of a piece-work job it is Sir Alan Cobham who, apart from having almost inhuman powers of physical endurance, has equally phenomenal powers of organisation and eloquence. If Sir Alan Cobham had not been appointed the Apostle of Aviation he might have been one of the World's finest Army staff officers.

So far as the London Press are concerned the papers have treated this historical event shabbily,—all except *The Times* which gave it three-quarters of a column. *The Daily Mail* apparently had nothing to say about the Conference, but devoted roughly £25 worth of space to the fact that at the subsequent Banquet the one woman present was called by several different names and smoked a cigarette.

However that matters very little. The London papers cater for the London mob. The essential guts of this country, thank God, are in the Provinces, and the Municipal Authorities of a hundred cities going home and getting to work on Municipal Air-parks and stirring up municipal rivalry with competing cities and towns, will do far more for the advancement of British Aviation than all the vapouring of Fleet Street could do.

Sir Alan Cobham has again done a great service to British Aviation, and the result of his campaign for British Aerodromes should be a great encouragement to him when he starts early in December, in *The Youth of Britain,* for Africa where, with Captain Gladstone and Mr. Tymms,—who have already gone ahead,—he is to start to work on organising the Imperial Airways route from Cairo to the Cape.—C. G. G.

THE NECESSITY FOR MUNICIPAL AIR PORTS.

[*Reported by the Staff of* THE AEROPLANE.]

When Col. Sempill opened the proceedings the hall was quite full so there must have been several hundreds of delegates to the Conference. One's only regret was that the various municipal groups were not banded together in their respective entities and furnished with banners and flags, but this one supposes is too frivolous an idea for such an occasion.

One could hear numerous people pointing out Sir Alan Cobham and his aide Capt. Ward as the people who had been instrumental in making the visitors air-minded. In many cases these visitors had been given their first flight by Sir Alan Cobham.

Col. The Master of Sempill opened the conference by introducing His Worship the Mayor of Westminster, Major V. B. Roberts, D.S.O., M.C., who had managed to find time to attend the conference in spite of his many pressing engagements.

THE MAYOR OF WESTMINSTER said that he felt it was a high honour to be asked to open a conference such as this

SEE YOUR CITY FROM THE AIR.—Birmingham's Guildhall.

Digitized by Google

which was an unique occasion in the history of this country. The City of Westminster welcomed these civic brethren from all over the country to this meeting which marked the arrival of the Air Age. Britain had had the privilege of leading in the development of most forms of transport. We had held the lead upon the Seas and we hold the same position in the Air. The Conquest of the Air was only 25 years old. Other nations were keenly alive to the importance of aviation and he felt that the development of municipal aerodromes was a very important link in the development of Civil Aviation in this country. There was no room for an air port in his municipality of Westminster. There was the possibility of utilising the Thames for seaplanes or when Charing Cross Station was moved south of the River, the roof of the new station might be developed as a landing space. An aerodrome had the possibility of becoming a Euston, or a Southampton, among air ports.

He then read a letter from Sir Kynaston Studd, the Lord Mayor of London, who was unable to be present. Sir Kynaston Studd, after regretting that he could not attend the conference, expressed his conviction that every town and city must have its air port and this question of landing-grounds must be threshed out. The Mayor of Westminster concluded by congratulating the three responsible societies on their enterprise.

The Chairman then called upon the Under-Secretary of State for Air, Mr. F. Montague, to speak.

Mr. Montague, speaking on behalf of the Secretary for Air, Lord Thomson, said that the latter was extremely gratified to learn of the very representative gathering at the conference. The need for air ports had been emphasised by the recent tour of Great Britain by Sir Alan Cobham in his Giant Moth which had been made possible by the generosity of Sir Charles Wakefield, who had been referred to as the Patron Saint of Aviation in Britain. The Directorate of Civil Aviation had looked forward to the acquisition of aerodromes by local authorities and had provided in Section 8 of the Air Navigation Act for the local authorities to confer with the Ministry of Health and the Air Ministry over any town-planning scheme so that provision might be made for an aerodrome site. He referred to the circular letter sent out by the Air Ministry to the municipal authorities stressing the need for more aerodromes. He mentioned that the subsidy paid to N.F.S. was dependent upon that organisation creating 20 new aerodromes and 100 landing-grounds in the course of the next three years. Four municipal aerodromes had already been licensed, namely those of Blackpool, Hull, Nottingham and Wythenshawe (Manchester) and ground for aerodromes had actually been purchased by Bristol, Carlisle, Plymouth, Manchester, and Stoke-on-Trent. Altogether 100 local authorities were actively engaged in the acquisition of aerodromes. He regretted that Sir Sefton Brancker, the Director of Civil Aviation, was detained by his duties in either Rome or Athens, as this was an occasion which the Director would have made a point of attending.

Col. The Master of Sempill said he would give the outline of the remarks on the development of civil aviation which Sir Sefton Brancker had intended to give, though he knew that he could not successfully imitate Sir Sefton's candour of oratory. Incidentally, before Col. Sempill began to read these remarks he said that if anybody was interested in statistics the Air League would be delighted to supply these and further, with municipal assistance, would supply lecturers.

Harking back to his subject, he said that the total mileage flown by civilian air lines during this year would total about 55,000,000 miles. Various slides were put on the screen, but these were changed so rapidly that there was little chance to gain their import, except the maps, which helped one to realise that France has organised her civil aviation almost entirely outside herself and that Germany has devoted herself to the development of air lines within her own borders, with one or two notable exceptions, such as the route across Russia and Siberia and the Junkers organisation in Persia.

He referred to the conditions obtaining after the War 1914-18, when the manufacturers of German aircraft were forced to open factories abroad. Three slides of the Dornier Do.*x* were shown as being the finest example of civil aircraft in the World. Some facts and figures of civil aviation in the U.S.A. were next given. The Transcontinental air-mail route from coast to coast was especially stressed, as was the use of night-flying in this connection.

The general conditions existing in the Dominions and Colonies were outlined. Australia is in the most advanced state with a ring of routes almost completely round the country. Canada is beginning to organise her routes, chiefly by means of generous contracts from the Postal Department. Canada, of course, for many years has been making use of the air with aircraft for fire-fighting and forestry patrol work. Referring to the Freedom of the Air, he said that although at the first meeting of the International Convention for Aerial Navigation, which met during the War 1914-18, the delegates had decided that the

[illegible] Major Richard spoke at the Hague when only Great Britain, Holland, Spain and the United States were represented at the meeting. A twenty-seven-page paper entitled "[illegible]" was read at the meeting, the author being unknown at the time.

Major L. F. Richard, Chief Aerodrome Officer at the Croydon Air Port, then read his paper on "The Administration of Airports." He said that the personnel required for the administration of an aerodrome would depend on the type of traffic to be dealt with and the amount. He proposed to outline the organisation required for running the smallest kind of aerodrome and then to deal with the administration of the largest.

He proposed to take as his examples the emergency landing ground at Penshurst and the Air Port at Croydon.

The small aerodrome would require a resident caretaker, who should be married and available for the whole 24 hours. This man would be directly responsible to the local authority. His duties would include the guiding of machines while taxying and pegging them down in the open if there was no hangar accommodation. He must keep trespassers off and constantly inspect the aerodrome equipment. He must obtain the pilot's signature, collect the necessary landing charges and repair minor damages to the surface of the aerodrome. He must be able to make simple weather reports. Cattle grazing over the aerodrome must be kept under control and the caretaker should see that these were placed in such a way that machines landing up-wind will not run into them. At the beginning of his paper Major Richard said that the caretaker must have tact. One would add and be long-suffering.

At a big port like Croydon there was the senior Aerodrome Officer and beneath him were five other aerodrome officers, amongst whom the various duties were divided.

The senior aerodrome officer has to see that the air navigation regulations are complied with as well as the local ones. One of the aerodrome officers is responsible for the handling of the machines on the ground and the Control-Tower officer has to keep in touch with all pilots. In case of fog he warns them of the proximity of other machines, and if necessary tells them to fly at different levels, so as to minimise the danger of collision.

The senior aerodrome officer on duty at night is respo[illegible]sible for all the lighting equipment and its management.

There is a look-out in the Control Tower whose duty i[illegible] to raise the disc with the firm's name on it which indica[illegible] that the waiting machine may leave the Customs area a[illegible] taxy over the aerodrome. The machine is not allowed [illegible] take off until a powerful light has been flashed as t[illegible] "All-Clear" signal to the pilot. The look-out has also [illegible] keep a watch for incoming machines and, when he sig[illegible] one, to give the signal. This consists of blasts in Mo[illegible] on a Klaxon, which warns the ground staff for duty. T[illegible] Morse signal indicates the firm operating the machine.

Out-going passengers are taken in charge by officials [illegible] the appropriate air line and taken to have their passpo[illegible] approved. After this proceeding they are taken stra[illegible] into the machine.

In-coming passengers are taken through the Customs a[illegible] then their baggage is loaded into cars. Meanwhile t[illegible] passengers are interviewed by the Immigration authori[illegible] after which they are able to drive away in the wait[illegible] vehicles already loaded with luggage.

On one occasion during the Summer they had [illegible] machines in and out in one day, and 2,000 passengers a[illegible] 112 tons of freight in the week.

Major Richard referred to the maintenance staff requir[illegible] Publicity was very valuable and the sightseers should [illegible] catered for, as they were the potential passengers of t[illegible] future. They employed a guide at Croydon who had a fu[illegible] time task of taking people round and explaining everythi[illegible] to them at 6d. per head.

Major Richard concluded by explaining that he had [illegible] deal with a very big subject in a very short time and th[illegible] if he had not made everything clear he would be delight[illegible] to welcome any delegates at Croydon and take them roun[illegible] when he could explain more fully.

A delegate then inquired whether Major Richard cou[illegible] supply any figures as to the cost of running Croydon. [illegible] reply Major Richard said that he had no figures availab[illegible] but with Air Ministry permission he would be delight[illegible] to furnish the figures.

Another delegate then inquired about the acreage requir[illegible] for an aerodrome and was told that this information wou[illegible] be contained in the next paper.

Still another delegate wished to know whether every ae[illegible]

"Bristol"

BULLDOG

SINGLE SEATER FIGHTER

In the design of the "Bristol" Bulldog the latest "Bristol" practice in high tensile steel strip construction has been incorporated, and the results of years of research and development work with steel aircraft structures are applied.

Climb and performance well in advance of anything previously obtained with a standard service aircraft are attained, along with ease and facility of control, exceptional strength, ease of maintenance and remarkable simplicity of repair. The Air Service, the pilot and the maintenance engineer—all agree that the Bulldog is the most redoubtable and practical aircraft obtainable to-day.

drome would have to have Customs facilities and whether, in the event of the aerodrome not possessing these, the local authority would be responsible for machines landing there and evading the Customs.

Mr. F. G. L. Bertram solved this difficulty by stating that if any machine did not clear at a Customs Airport such as Croydon or Lympne the responsibility rested on the local police and the pilot. If any municipal authority wished to provide Customs facilities the housing for the Customs would have to be built by the owners of the aerodrome but the staff would be supplied by the Board of Customs and Excise.

Another seeker after knowledge said there had been much talk about "heliocopters," and wanted to know whether the increasing use of machines of this type would reduce the landing area required. Col. Sempill intervened and said that the Conference was concerned with aircraft in use to-day and that in any case a very small landing ground would only be of use for one machine at a time. It was therefore necessary, in any case, to have an aerodrome of normal dimensions.

The next delegate said that Hythe was only two miles from Lympne. There were also aerodromes at Littlestone and Hawkinge. Was the local authority there to build another aerodrome and make a fourth? He was informed that one of the aerodromes he had mentioned belonged to the Royal Air Force and could only be used by civil aircraft in emergency and that Littlestone was an emergency landing ground. There was no reason why another aerodrome should be built however.

Major R. H. S. Mealing, who is Technical Assistant in the Department of Civil Aviation at the Air Ministry, then read his paper on "The Lay-out and Equipment of Airports." He said that Major Richard had assumed the possession of a suitable aerodrome. He had to start earlier and suggest the way that air ports should be laid out and equipped.

It was necessary for any air port to be licensed for use by the Air Ministry as otherwise it could not be used by aircraft plying for hire or reward. Such a licence signified that the air port provided an area of land sufficiently large and level for an aeroplane to land and take-off safely under any wind conditions. The buildings and equipment are not licensed as such. Before an aerodrome can be licensed the site must measure at least 600 yards in each direction but 1,000 yards in each direction is very much better. These are equivalent to areas of 75 and 200 acres.

The ideal air port would be as level as a billiard table, but the average gradient should not exceed 1:50. This is an average figure. Any particular undulation should not exceed 1:40.

A rough and ready test is to borrow somebody else's car and drive it at 20 miles an hour over the proposed aerodrome. If the passengers are not unduly inconvenienced the surface is good enough for an aerodrome. If one can drive a fully-laden 3-ton lorry with solid tyres over the same surface, and not have it sinking in, the surface is good enough for ordinary machines to land on. The minimum pressure that an aerodrome has to withstand is just about ¾ of a ton per square foot. In this country a turf surface can be easily provided and maintained and an artificial form of covering is not likely to be necessary.

An important condition for licensing an air port is that there should not be any surrounding obstructions such as trees, chimneys and the like. Generally speaking, an obstruction on the border of an aerodrome will reduce the available landing area by about fifteen times the height of the obstruction. Thus the necessary conditions for obtaining a licence are adequate dimensions, a suitable surface and lack of obstruction.

The next thing is the question of luxuries. These are not really luxuries but progressive necessities. The most meagre requirements for an aerodrome are a landing circle, the name of the town, marked on the ground, a wind sleeve to show the direction of the wind, facilities for the supply of petrol and oil, and a telephone. A better equipped air port will possess facilities for sight-seers. The advantages of providing for these people had been stressed by Major Richard.

If air-lines are going to be operated from the aerodrome there will have to be offices for the sale of tickets, buffets for refreshment and probably a restaurant. Probably in time aerodromes on main air routes will require hotels. There should also be a rest room and sleeping accommodation for pilots.

With the introduction of all-metal aircraft the time will come when a hangar will not be required for housing such machines. On the other hand mechanics will require cover under which they may work when effecting necessary repairs. On an aerodrome of this size there will have to be accommodation for workshops. He would not tell them where to put their buildings but would emphasise the places where they must *not* be laid down. The prevailing wind in England is from the South-West. Therefore buildings

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

placed in the North-East or South-West corners will be obstructions for the greater part of the year.

Sooner or later there will have to be wireless or meteorological facilities at every air port.

With the development of night-flying, lighting facilities will be required to enable pilots to land safely at night and at the same time to identify the air port. For that purpose a location light will be required which must be of a distinctive colour. At Croydon they were shortly erecting a large "T" which will be painted white for use by day and illuminated with red Neon tubes by night. This apparatus will always point head to wind.

The air port will also require boundary lights to outline its outskirts. Obstructions must have obstruction lights and a flood light must be employed to illuminate the ground for night landings.

If authorities are not yet prepared to construct an air port they can at least reserve ground for such a purpose. Provision has already been made in the Air Navigation Act for local authorities to establish air ports and carry on any business in connection therewith. They may also raise a loan for the purpose of establishing an air port. Under certain circumstances actual financial assistance can be obtained from the Unemployment Grants Committee.

At the conclusion of his lecture Major Mealing showed some pictures of representative air ports in England, Europe and America. These were particularly interesting as showing the difference between the various surfaces employed, the use of runways being specially noticeable in America.

Col. Sempill said that in view of Major Mealing's offer to confer with any interested local authority he thought that the delegates would abstain from asking him questions as they could question Major Mealing at their leisure when he visited them.—T. J.

The Originator of The Campaign.

Sir Alan Cobham, K.B.E., A.F.C., who addressed the Conference on "The Selection of Air Port Sites," asked his audience not to be unduly alarmed by the awful expenditure on air ports required by the previous speakers. All that was really wanted at the moment from the Municipal Authorities in each case was a plain level piece of ground.

At present the Municipal Authorities were in the unique position of being first in the field. The first air port in any town should always be the best one. Those who took the opportunity now would get the best site. A good many towns only possessed one really favourable site. The people who selected that site would have the most favourable position for operation.

The selection of a site for a Municipal Aerodrome should not be made in haste. The environs of a town should be thoroughly combed. In the first place the people making the choice should fly round and over the town, not once or twice, but perhaps twenty times. They should pin-point on their maps every possible place and also every possible combination of fields, etc. In addition they should investigate every possible site shown on a 6-inch ordnance map. Then by a series of eliminations they would get the best aerodrome.

A very important point in the selection of a site was the limits of the land available. Although Air Ministry regulations for an aerodrome only demanded a run of 690 yards in two directions they should remember that this limit was only possible where the other circumstances were advantageous. On some sites 1,500 yards was not enough. A great deal depended on the surrounding country and the possibility of obstructions. Any obstruction nullified the area by fifteen times its height laid on the ground. Municipal Authorities would find it necessary to purchase the approach ground to their aerodrome in order to prevent building.

In industrial areas the aerodrome would have to be from twelve to fourteen hundred yards in all directions. He had seen some proposed sites which were on small plateaux. If the plateau was not too high this might be an ideal position. The plateau was there for ever and the approaches were safeguarded from building by the slope away from it, or even if it was built on, the roofs of the houses would be below the level of the aerodrome.

Other difficulties were the possibility of high-tension cables and wireless masts being built. A wireless mast could ruin the whole of one side of a town for the purpose of an aerodrome. If the Authorities got to work on their aerodrome without delay this trouble ought not to arise because those who were building wireless masts and laying cables were in close co-operation with the Air Ministry. Another difficulty might be the proximity of hills. Not only was there the difficulty of climbing over the hill in an aeroplane but there was also the dangerous down current from the top of the hill.

Above all, Municipal Authorities must consider the possibility of expansion. There was bound to be a boom in

aviation in the near future. The problem of air congestion was already making itself felt in certain aerodromes. Any organisers of flying meetings to-day might expect from 60 to 100 visiting aircraft and if they all arrived within an hour machines would be landing on the aerodrome at the rate of one every minute.

Air transport was not a luxury method of travel. It was essentially a method of speed. There was no advantage in saving time by travelling by air if the time was to be lost between the aerodrome and the town. The aerodrome must be as close to the centre of the town as was practicable.

Another problem to be considered was the meteorological one. Factors to be taken into consideration were smoke drift, fog, and low clouds. Smoke might drift up a valley and leave a plateau clear. Fog would be found in low-lying districts and low cloud was frequently found on high land. In his experience the thing which stopped flying more than anything else was low cloud. With it visibility was nil. On the other hand ground fog hindered the operation of air transport very little. Meteorological observations should be taken over a period of time before deciding on any site.

Finally, he warned Municipal Authorities against making a mistake in their selection of a site. If they bought land that was unsuitable they could spend more and more money on it and still it would not make a good air port. As time went on their air port would have vested interests. Operating firms would be established, flying schools and clubs might come there and aircraft factories would be built there. These vested interests would make it impossible to change the site. Municipal Authorities ought to look fifty years ahead. They might buy land to-day and only only use half of it but they must always remember that they would need plenty of land for expansion. Buying land now would save greater expenditure in the future.

Lord Herbert Scott, C.M.G., D.S.O., President of the London Chamber of Commerce, who addressed the Conference on "Trade by Air," said that in the United States of America the development of Civil Aviation had been largely assisted by the co-operation of the Chamber of Commerce. The American Chamber of Commerce had made the American business man air-minded. The London Chamber of Commerce was doing everything possible to encourage Civil Aviation and the other Chambers of Commerce throughout the country were joining in the movement. This was proved by the way in which the Manchester Chamber of Commerce had turned out and cheered their Lord Mayor on his way when he had flown to London to get the licence for the Manchester Air Port. They had realised that in this way a busy man was saving a great deal of time.

He (the speaker) had great faith in the future of the flying-boat. He thought that the British flying-boat had a great future before it and would be of inestimable value in linking up the Colonies and Dominions with the Mother-country. He thought that air ports for seaplanes and flying-boats were as important as air ports for land machines.

The British public had splendid examples in front of them in the practical interest in air transport shown by His Royal Highness the Prince of Wales and by the Prime Minister. This country had the finest aircraft in the World and the best pilots, but sea and inland air ports were essential for promoting trade by air.

Colonel the Master of Sempill, closing the Conference said that on behalf of the three Societies which had organised the Conference he wished to thank the Municipal dignitaries for attending the Conference, and he hoped that they had heard things which would be of value to them.

The Lord Mayor of Hull (Mr. Benno Pearlman) said that he was sure that he was voicing the feelings of all present in expressing their deep appreciation of all those experts who had addressed the Conference and given them so much valuable information and advice. The opening of the Hull Municipal Air Port had taught the people of the City and County of Kingston-on-Hull a lesson in airmindedness. He could not say how many people had been present at the opening ceremony, but they had been able to give £1,000 to the medical charities of the City from the takings on that day.

He warned the other Municipal Authorities present that the starting of an aerodrome required the patience of Job and the temperament of an angel from Heaven. Unquestionably this country was behind other countries in this matter. Those who had not yet started to get an aerodrome would benefit by the errors made by those who had started one.

It was only since the opening of the Hull Air Port that he had discovered how many Authorities there were in London who were ready and willing to give advice. He hoped that the example set by Hull would be so emulated by the other Municipalities that people who wanted to fly from one place to another would be able to do so without trouble.—C. M. MCA.

THE BANQUET.

On the evening after the Conference Sir Charles Wakefield entertained at the Savoy all those who had been at the Conference, and a number of members of the Aircraft Industry, and sundry other celebrities.

The guests were all men with the exception of Mrs. Councillor Luard, M.B.E., Mayor Elect of Hereford, which fact led to quite a good deal of amusement. Mr. Knightsmith, the perennial Toastmaster, giving the Royal Toast, began with, "Mr. Chairman, My Lord, My Lord Mayors, Mayors, Lady and Gentlemen." Sir Eric Geddes added to the formula "Lord Provosts" and ended with "Worshipful Madam and Gentlemen." The Toastmaster varied this by making it "Lady Mayoress Elect." Colonel Sempill invented the phrase "Right Worshipful Elect Madam," and Lord Herbert Scott addressed her as "Worshipful Lady Mayoress To Be."

Sir Alan Cobham earned a cheer by including "Town Clerks and Borough Surveyors," all of which added to the gaiety of the occasion and was immensely appreciated by Mrs. Luard herself.

After the Royal Toasts, Sir Charles, proposing the Toast of the Municipal Air Ports of Great Britain, said that this Conference marked a turning point in the development of British Aviation, and that it was due to the work of one man, Sir Alan Cobham. Enthusiasm was always the preliminary to progress.

The Lord Thomson of Cardington, Secretary of State for Air, made the finest speech he has ever made in connection with aviation, and one greatly regrets that it cannot be reported word for word. Although restrained in manner it was the speech of an enthusiast and it was real oratory.

He said that he doubted whether any other form of transport could have assembled so many municipal representatives, and reminded us that civic pride had never clashed with national interests. He hoped that the municipal authorities would all go home resolved to have air ports throughout the country. The towns of Great Britain needed as many aerodromes as they had railway stations and in more accessible positions.

As a nation we depended on transportation. The Royal Air Force by its immense efficiency made us safe against immediate danger of offence. Transport was needed to link the Empire together.

Through stupidity or timorousness we had shirked developing this new mode of transport. No sacrifice was too great to make our race the most efficient in the World.

We had now had this great conference and this Banquet thanks to Sir Charles Wakefield and Sir Alan Cobham. He wanted those present to go out and make their people think like themselves. He recalled that when Pitt had been told that he had saved England, he had replied that the people of England had saved themselves by their exertions, and had saved Europe by their example. We must teach our people to be strong and efficient, thus we should get peace for ourselves and for the Western World.

Sir Eric Geddes, Chairman of Imperial Airways Ltd., said that we could not have serious aviation without air ports. For long flights abroad infrequent airports were enough, but for short distances air ports must be frequent and convenient. He quoted figures showing that since 1920 air-line flying had increased by hundreds per cent. in distance, number of passengers and weight of goods carried, and added that since 1920 internal flying had only increased by 25%.

Imperial Airways had to refuse many charters because there were no reasonable aerodrome facilities in this country. For long journeys entailing an over-night stop an air port might be five or fifteen miles out of a town. For taxis aerodromes must be near business centres.

For the state of our aviation the Air Ministry got most of the abuse and Imperial Airways got the rest. He did not grudge the Air Ministry their share. He compared the Air Ministry to the cow of the Scots farmer which although it had no pedigree and no milking record was "an awfu' guid coo" because it gave all it had.

Sir Eric said that this country was never a good starter but it always finished well. In aviation it had kept up the reputation of our race for being a bad starter. To-day Germany had 80 air ports, the United States had 1,500, and England had four. At the finish every English municipality must have an air port. And the sooner the better, for as towns grew ground would cost more.

Here Sir Eric made a statement which ought to become the prime argument in all air port campaigns, he said that after going into all costs thoroughly and having them checked in every way he found that a reasonably well-equipped aerodrome, about 600 yards square, cost a very little more than one mile of a modern arterial road. He said that he did not think that any town would refuse to lay a mile of new road if it would bring business.

In conclusion he said that this dinner was the culmination of one of the finest campaigns ever conceived. He congratulated Sir Charles Wakefield on his generosity and foresight and Sir Alan Cobham on his genius and flair.

Colonel the Master of Sempill, proposing British Air Transport, said that this day in future ought to be known as Sir Charles Wakefield's Day instead of as Guy Fawkes Day. It was the day when the Civic Voice had proclaimed that it wanted air ports and more air ports.

He pointed out that the work of Sir Eric Geddes and of Imperial Airways was of great significance. It was washing the Empire in something unlike Lux and causing it to shrink. Sir Alan Cobham's great flights had been successful without any ground organisation and showed what could be done if ground organisation existed, and we must remember that of all ground organisation that required for aviation was the most easily organised.

He recalled that in the days of Roman Britain an Emperor had travelled from Rome to Britain and back in precisely the same time as had been taken by a British Ambassador going to Rome and back in 1830. Thus there had been no advance in ground organisation in 1,500 years. To-day was the time to think of a new ground organisation.

Lord Herbert Scott congratulated Sir Alan Cobham on his good spade-work all round the country. [Presumably there is no reference here to the effects of tail-skids on aerodromes.] People could only be convinced by practical example. Motor transport was now a serious rival to railways. Air transport had come into its own. It must go ahead and capture this great new industry. He said that self-satisfaction was disastrous to trade.

Sir Alan Cobham said that he was proud of being able to speak to such a gathering. He had in fact spoken to all of them before and he had taken most of them up in the air for the first time. He said that he had the happiest memories of his tour. He had taken up many valuable loads of Mayors and Municipal Officials—and, he added, just before starting he had often been told by their rivals to "take 'em up and drop 'em all out."

He had sometimes been asked why we should have air ports. The answer was that we could not fly without them. You could not run a car without a road or ships without ports. If the development were left to private enterprise we should wait a very long time. Aerodromes were public facilities like roads or bridges. Each of these was an advantage to the city which it served.

Aerodromes should be the property of the municipalities and should not be left to a monopoly of private enterprise who might get a throttle-hold on the whole system. The municipalities should be the ground landlords and they might leave the work of the aerodromes to private enterprise.

Not till every country had an air mail service could we realise the good of air mails and not till we had air ports could the uses of air-parks be appreciated. The making of air ports was cheaper to-day than it could ever be.

The Lord Mayors and Mayors of 1929 and 1930 would go down in History as the people who had put aviation over. If only we had as many aerodromes as we had golf courses aviation would be a success. He ended by saying that but for Sir Charles Wakefield all this campaign would have been impossible.

Sir Charles Wakefield proposed the Toast of the Guests and said in just so many words how pleased he was to have us there.

Councillor Pearlman, Lord Mayor of Hull, whose speech went down with great effect, replying, extended the grateful thanks of Hull for Sir Charles Wakefield's support in getting the Supermarine-Rolls-Royce S.6 to that city for their Civic Week. He admitted openly that Sir Charles had paid for getting it to the city. He emphasised the fact that nobody had done so much to foster aviation as had Sir Charles.

He said that air service was now a practical business proposition. Any town without an aerodrome in the near future would be "relegated to the limbo of parochial obscurity." Hull had got the first fully operative municipal aerodrome in Great Britain and it had been got by "pertinacity, audacity and tenacity of purpose." He envisaged a chain of air ports from Belfast to Manchester and Leeds and Hull, whence the great air-liners would serve Northern Europe.

Turning to Sir Eric Geddes, he remarked almost menacingly that it was up to Imperial Airways to run their line from Hull to Europe and that if Imperial Airways did not do so foreign lines would get the trade. [This struck one as a trifle unkind seeing that the flying-boat fleet of Imperial Airways is immobilised in the Mediterranean.]

Continuing, Councillor Pearlman reminded us that Sir Alan Cobham's tour covered 60,000 miles in 21 weeks, that he had taken up the Municipal Authorities of about 100 cities and towns and 10,000 children as well.

Sir Herbert Hambling said that he had never seen so many gold chains in his life, and he thought that the Governor of the Bank of England, if there, would like to annex them. Nobody but Sir Charles Wakefield could have got them together or could have got so much done as had been done that day.

Sir Philip Sassoon, proposing the Chairman, said that he could testify personally to the kindness and energy and enterprise of Sir Charles Wakefield. He was rightly looked upon as the Patron Saint of British Aviation. He had done more than any single living man for British Aviation. Now he had opened a new chapter in our history of aviation. He had enlisted to help him the heads of all our Municipalities and the Youth of Britain as well. He was to be congratulated on his success.

So ended what has been certainly one of the most remarkable events in the history of aviation. There is no doubt that it marks a critical point in the psychological momentum of the British people. Without in any way suggesting that from now on the development of aviation in Great Britain and in the Empire is going to be all plain sailing, those who are prepared to work and give their best to the development of aviation in this country will find, like travellers who have climbed a hill, that at any rate the general grade is in their favour in future.—C. G. G.

Ref. FTH/WU.

Messrs. C. C. Wakefield & Co. Ltd.
Wakefield House,
Cheapside. E.C. 2.

Dear Sirs,

You will undoubtedly be pleased to hear that the SEALED GIPSY Engine has now completed its 600 Hour Reliability Trial, and we have now unsealed and opened it for Inspection.

During this period, 51,000 miles have been flown in addition to 61½ hours running up and taxying. At the conclusion of this trial, the performance was checked and found to be equal, in every way, to that of a new Engine.

The way in which this GIPSY Engine has maintained its tune after such an enormous mileage, without decarbonisation is a great tribute to the quality of the CASTROL XXL Oil which was used throughout the Trial, and fully justifies us in recommending its use to all who operate GIPSY MOTH Light Aeroplanes.

Yours faithfully,
FOR THE DE HAVILLAND AIRCRAFT CO. LTD.

DIRECTOR.

A great tribute to the quality of

WAKEFIELD

AUTHORS AND AVIATION.

On Nov. 4 the fortnightly after-dinner discussion at the Authors' Club was devoted to "Air Facts and Problems." Dr. A. P. Thurstan was in the Chair and the guest of the evening was the Secretary of State for Air, Lord Thomson.

Opening the discussion Lord Thomson said that about the gravest problem he had to face at present was the expansion of the Air Forces of other countries. Even in America, apparently the safest of all countries, expenditure on aviation had increased by 124%, and all over the World countries were spending money on air services which was not justified by their Budgets. Unless a halt was called competition in other forms of armament would be insignificant compared with that in aviation. Service and civil.

Lord Thomson said that he personally had always believed in spending money on ground organisation and leaving the air operators to pay for their machines, just as taxpayers and ratepayers paid for roads and harbours and left the users to develop the vehicles.

There was the greatest difficulty in getting money to spend on developing air routes. Therefore he was very glad to see that the Municipal Authorities were now tackling the subject in a practical way. He referred to the visit (on the following day, Nov. 5), of 450 gentlemen representing 100 Municipalities throughout the country all desirous of establishing aerodromes. He remarked that many of them had made their first flights with Sir Alan Cobham in a state of trepidation and had descended from the aeroplane full of confidence and convinced that they were to be pioneers of a great movement.

Further, Lord Thomson said that since 1924 he had been an unrepentant believer in the future of lighter-than-air transport. He said that he had been trained as a Sapper but did not claim to be an engineer, in fact many engineers would deny that he could be one. But he had felt that lighter-than-air transport was a problem to be solved.

As an Empire we were divided by wide ocean spaces and we had to find something able to travel those spaces using cheap fuel and with ample accommodation. For that reason he had spent nearly four weary months in the previous Labour administration wrangling with a sub-committee of the Cabinet in which his principal opponent was a very determined Yorkshireman. Eventually he had extracted from him a large sum of money for a great experiment.

He emphasised the fact that R.101 was an experiment and that the men who produced it were highly competent. He claimed modestly that if he himself had any quality it was that of spotting men. He had spotted these men in 1924 and had no reason to go back on his opinion. He described his voyage in R.101 when he conducted his office operations in comfort and enjoyed himself thoroughly.

He said that when he last visited New York twelve tugs were needed to pull and push the *Majestic* into position for docking, and yet people sneered at airships because 300 men were needed to get it into its shed. He held that R.101 was a great improvement on any ship that now existed and was much stronger than the *Graf Zeppelin*. She might not be as fast as he would like, but she was a big step forward.

He divided the opponents of airships into four categories: First, the natural obstructionists and the timorous; second, the shipping companies, who feared a rival; third, the petrol retailers, who objected to fuel at £5 a ton compared with their £25 a ton; and fourth, the champions of heavier-than-air craft.

The majority of experts at the Air Ministry were against airships. He believed in heavier-than-air craft, but in our great Empire there was room for every kind of progressive development. Five years ago we were the only country building airships. To-day two others were spending large sums on such experiments. The greatest airship expert in America had told him that England now had a start of three years in this matter.

Speaking as an author Lord Thomson said that the only book out of which he had made any money was *Air Facts and Problems*, and that was not because many people bought it, but because he had sold the serial rights to an American newspaper.

Dr. A. P. Thurstan referred to the great performances of Orlebar, Waghorn and Atcherley, who had flown at six miles a minute half the velocity of sound, and expressed his belief that in a few years time we would be flying faster than sound. There was now no part of the World more than a week's flying away, with existing machines and given proper ground organisation. We now had heavy oil engines which were setting a lead to the World and would probably revolutionise motor-cars. He wanted to know when we should get fresh strawberries from Australia by airship or aeroplane.

Major-General E. B. Ashmore, who organised and commanded the London Air Defence Area during the War 1914-18 argued that even if we reached international disarmament we should always need proper air defence, for otherwise any nation could turn its civil aircraft into bombers. They would be little use against proper defence, but they would be good enough against the defenceless.

In any case we should always need some armament if only for police duties. In terms of the police we might say that the Navy were needed for traffic control, the Army for point duty and the Air Force as a flying squad. The World was daily becoming smaller, distant countries were becoming neighbours, and he could not believe we should ever be in the position in which we were some years ago when during an acrid discussion with a foreign Power, London was found to be entirely without self-defence.

Mr. Fred Sigrist, Joint Managing Director of the Hawker Engineering Co., Ltd., under whose management the Sopwith Co. turned out some 15,000 aeroplanes during the War, said that he did not believe in large airships. They were expensive to run and handle, they were hopelessly fragile, and had few practical uses. The mere periodical examination of the structure was difficult, and in some places practically impossible except at immense cost. And the rate of depreciation was prohibitive.

On the other hand, Civil Aviation was making great strides, and the organising of municipal aerodromes would popularise aeroplanes. He said that we were only on the edge of commercial aviation. It could not function without a subsidy in this or any other country and the designer had received little encouragement to produce better aircraft for transport.

Colonel the Master of Sempill referred to the magnificent work done by Sir Charles Wakefield, and drew particular attention to his latest good work in financing the recent campaign in favour of municipal aerodromes, culminating with the Meeting on Nov. 5.

Mr. Nichols Marcy, speaking as the father of an officer in the R.A.F., objected to the Short Service system which took a boy from school, gave him five years in the Air Force and then threw him out to make a living without any trade or profession, and unable to find work. [Mr. Marcy has evidently not studied this question in all its aspects, and evidently does not know that under the existing system of vocational training an Air Force Officer can fit himself for a good job on leaving the Service just as if he had gone to a University. Also apparently he does not know that something over 75% of officers who leave the R.A.F. on expiry of their Short Service commissions are found jobs within a very short time.—C. G. G.]

Sir Alliott V. Roe spoke on the lack of money for aviation.

The whole affair was very pleasant, the speeches were commendably brief, and consequently there was plenty of time for those present to enjoy individual conversations before they had to go home.—C. G. G.

THE R.100.

According to the Goole correspondent of *The Times*, the date for launching the airship R.100 from Howden Air Station has been fixed for Nov. 15, if the weather is favourable and the mooring mast at Cardington is not in use by the sister ship, R.101. Dead calm weather will be necessary, and the attempt will be made at dawn.

Three hundred soldiers from Fulford Barracks, York, are to manœuvre the ship from the shed, helped by the Airship Guarantee Company's employees.

According to the paper, "Tests will be concluded in the next few days and the delay is because the mooring mast at Cardington, the only one in the country, is being used by the other vessel. Sq. Ldr. Biosh will be in charge during the flight."

The last paragraph is hopelessly wrong. The ship could have been out three months ago, but for delays caused by differences of opinion concerning details of design. And the officer's name is Booth.

THE PEREGRINATIONS OF R.101.

On Nov. 1 the R.101 left Cardington at 09.40 hours and was away for seven hours. The passengers included Sir Samuel Hoare, formerly Secretary of State for Air.

The airship passed over Sandringham, where H.M. the King was in residence, and cruised over the East Coast. She also flew over Norwich, where the staff of Boulton and Pauls, Ltd., could observe the effect of their handiworks.

During this trip the engines were opened right out and a speed of nearly 70 m.p.h. was obtained. This was satisfactory as being practically up to estimate.

On Nov. 2 the R.101 left Cardington at 20.12 hours and was away all night. During this time she flew over the Channel, where she made speed trials in the vicinity of the Needles.

These speed trials were made over a triangular course and also over a straight course of fourteen miles.

The results of these trials have not yet been worked out, though the estimated maximum speed of 70 m.p.h. is known to have been nearly attained.

After her night out R.101 returned to the mast at 8.15 hours, or with the milk. And, as is often the case after a night out, the reveller had difficulty in finding the keyhole. In R.101's case one of the side guys bent an auxiliary girder near the nose and distorted a steel bracing-tube attached to the mooring-spindle.

The night's revelries also caused intestinal trouble, certain tubes actually splitting. Aluminium bends in the cooling systems of three of the four forward-working engines cracked and had to be replaced with rubber sleeves.

No doubt as the ship gets older she will forswear these nocturnal outings and her constitution will thereby suffer less injury.—T. J.

TO AIR-NAVIGATION STUDENTS.

The series of classes organised by Capt. A. G. Lamplugh, which are the road for admission to the Ancient and Honourable Order of Air Dogs, seem to be going very strong. The lists are full up, and at the last class there were 32 people present, with the result that there was not enough seating for them and members threatened to bring their own camp-stools next time.

These classes are a most valuable institution, for the knowledge gained thereat makes all the difference between a man being a genuine pilot and a mere motor-driver. And of course membership of the Guild of Air Pilots and Navigators makes all the difference between being classed as a ship's officer or as a mere taxi-driver.

As there is no possibility of joining these classes this session, would-be students are strongly advised to get in touch with the organiser, Capt. A. G. Lamplugh, The British Aviation Insurance Group, 3 and 4, Lime Street, E.C.3, with a view to joining the next series of classes.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, October 29.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—J. A. H. Louden is reinstated as a Plt. Off. with effect from Oct. 17, and with seniority of July 30, 1928. The following Plt. Offs. are promoted to the rank of Flg. Off.:—J. S. Pole (Sept. 16); H. P. Wilson (Oct. 2); H. D. McGregor, W. H. Jones, F. R. Jones (Oct. 13); C. G. Davies (Oct. 18) (with seniority of Oct. 13).

Flt. Lt. B. D. S. Tuke is placed on the retired list (Oct. 28); Lt. S. C. Woolley, R.M., Flg. Off., R.A.F., relinquishes his temp. comn. on return to Corps duty (June 15). (Substituted for the notification in the *Gazette* of June 25).

Group Capt. E. F. Briggs, D.S.O., O.B.E., is placed on the half-pay list, scale A (Oct. 25).

MEDICAL BRANCH.—J. G. Skeet is granted a temp. comn. as a Flt. Lt. with effect from and with seniority of Oct. 14; Flg. Off. J. J. MacAndrews, M.B., resigns his S.S. comn. (Oct. 23); Flg. Off. H. D. Humphreys is promoted to the rank of Flt. Lt. (Dental) on promotion to the rank of Captain in the Army Dental Corps (Jan. 27).

CHAPLAINS BRANCH.—The Rev. C. A. Smith is granted a S.S. comn. as a Chaplain (Roman Catholic) with the relative rank of Sq. Ldr. (Oct. 18).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTES BRANCH.—The following Plt. Offs. are promoted to the rank of Flg. Off.:—J. M. Gittins (Oct. 23); G. H. Thevenard (Oct. 24); G. M. Randall (Oct. 25). The following Flg. Offs. are transferred from Class A to Class C:—G. P. W. Chandler (Aug. 22); J. V. Holman (May 1); R. K. Coupland (Oct. 29); A. N. Francombe (Oct. 11).

Flg. Off. F. V. Gauntlett relinquishes his comn. on completion of service (Oct. 29).

The comns. of the following Plt. Offs. on probation are terminated on cessation of duty:—J. K. Watson (Sept. 24); P. A. Jessel (Aug. 22); E. M. Wright (Aug. 22).

Appointments.

Week ending November 5.

GENERAL DUTIES BRANCH.—Squadron Leader A. McR. Moffatt, to No. 23 Group H.Q., Grantham, 2/10.

Flight Lieutenants J. L. Wingate, to A. and G. School, Eastchurch, 23/9. G. Combe, to A. and G. School, Eastchurch, 23/9. D. R. W. Thompson, to No. 10 Group H.Q., Lee-on-Solent, 27/10. V. S. Parker, D.F.C., to No. 22 Sqdn., Martlesham Heath, 27/10. H. V. Pendavis, D.S.O., to Home Aircraft Depot, Henlow, 1/10.

Flying Officers H. F. Luck, to Royal Airship Works, Cardington, 2/9. G. E. G. Lywood, to Station H.Q., Mount Batten, 26/10. T. O'N. East, to E. and W. School, Cranwell, 29/9.

Pilot Officers R. P. Garnon-Williams, to No. 25 Sqdn., Hawkinge, instead of to No. 23 Sqdn., Kenley, as previously notified, 3/10. P. B. Rogers, to No. 23 Sqdn., Kenley, instead of to No. 25 Sqdn., Hawkinge, as previously notified, 3/10. D. H. F. Barnett, to No. 5 F.T.S., Sealand, on appointment to a Perm. Comn., 5/10. J. A. H. Louden, to No. 24 Sqdn., Northolt, 17/10. J. S. Tanner, to No. 2 F.T.S., Digby, 23/9. The undermentioned Pilot Officers are all posted to R.A.F. Depot, Uxbridge, on appointment to S.S. Comns. with effect from 11/10:—C. F. G. Ayde, C. P. F. Alderson, I. O. Baldwin, J. N. Baxter, N. V. Bertram, B. W. E. R. Bonsey, M. Q. Candler, W. O. J. Coke, V. A. Dawson, C. C. M. Dunman, F. P. R. Dunworth, N. Foster-Packer, H. M. Gahan, F. B. H. Hayward, T. E. Dunville, N. Hill, M. V. Johnstone, N. D. Lamb, G. W. Lawson, D. McGregor-Cheers, L. E. P. Mahon, D. E. Milson, W. S. Moody, P. E. L. A. Myers, R. W. H. Rayneau, E. G. Reed, P. A. Smith, J. F. Sutton, C. H. Williams, S. M. Worrall.

MEDICAL BRANCH.—Squadron Leader (Dental) R. H. Bebb, O.B.E., to H.Q., 'Iraq Command, 8/10.

Flight Lieutenants E. C. K. H. Foreman, to Station H.Q., Bircham Newton, 13/11. C. W. Coffey, to Station H.Q., Biggin Hill, 30/10. J. G. Skeet, to Central Medical Establishment, 14/10. F. W. Goodread (Quarter-Master), to No. 1 Stores Depot, Kidbrooke, 8/10.

Flying Officers G. H. J. Williams, to No. 3 F.T.S., Grantham, 3/10. T. A. Edwards, M.B., to Station H.Q., Hornchurch, 5/11. N. M. Jerram, to R.A.F. Pathological Laboratory, Halton, 6/11.

ACCOUNTANT BRANCH.—Flight Lieutenants J. J. Caiger, to No. 1 F.T.S., Netheravon, 11/10.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident in Hong Kong Harbour to a Fairey IIID machine of No. 442 (Fleet Spotter Reconnaissance) Flight, Kai Tak, on Oct. 29, Flg. Off. Albert Ross Ward, the pilot of the aircraft, was killed. The other occupants of the aircraft were uninjured.

The R.A.F. in Palestine.

Group Captain P. H. L. Playfair, M.C., who was in command of the British forces in Palestine during the disorders there in August, gave evidence on Nov. 4 before the Commission of Inquiry held at Jerusalem. *The Times* report states:—

Group Captain Playfair's evidence began with Aug. 18, when Mr. Luke, the Chief Secretary, first requested that armoured cars be held in readiness owing to the increasing ill-feeling, predicting at the same time that the test would come on the next Moslem Sabbath. Group Captain Playfair was urgently called to Jerusalem on August 23, and before leaving Amman he ordered the Transjordan Defence Force to stand by. Subsequently he ordered an air demonstration over Jerusalem, while armoured cars reconnoitred the Ramleh and Jaffa districts.

Arriving in Jerusalem late on the Friday afternoon, he learnt that the situation was grave and asked for additional reinforcements of ground troops from Amman. He divided his three sections of armoured cars thus:—One was ordered to patrol the frontier, one was left at Maan, and one despatched to Ramleh. He ordered 18 aeroplanes to go from Amman to Palestine. He cancelled all leave and simultaneously decided with Mr. Luke to ask for an infantry battalion from Egypt until the arrival of other troops.

On the following day the Royal Air Force, with a numerically weak British section of Palestine police, answered many calls in and around Jerusalem, especially at Ramleh, where an armed tender encountered a concentration of armed Arabs. Group Captain Playfair's object was to concentrate the British police in the city, using mobile units in the outlying districts for the threatened Jewish colonies.

The first tender was sent to Hebron about 10 o'clock on the Saturday morning, when the massacre was first reported, but it failed to reach its destination before 2 o'clock, because it met with armed Arabs on their way to Jerusalem.

The total British strength on his taking over command was 13 officers, 175 men, and three sections of armoured cars, and he found himself confronted with the difficult task of protecting a minority against a very strong majority of attackers, operating in small bands but constituting a force of military significance, whose object was to attack individual Jews and the property of Jews scattered in 135 agricultural settlements.

The R.A.F. War Memorial.

A brief ceremony will be held at the R.A.F. War Memorial on the Embankment on Sunday, Nov. 10, at 12.30 hours. This ceremony will take the place of the one which has been held for several years on Armistice Day.

Air Marshal Sir John Higgins, K.C.B. (Air Member for Supply and Research, the Air Council), will lay a wreath on the Memorial on behalf of the R.A.F. and of the Executive Committee of the R.A.F. Memorial Fund, in memory of the fallen of all ranks in the War 1914-18.

Although no invitations are being issued, the Committee hope that relatives of the fallen and friends will attend the ceremony.

The Journal of the R.A.F. Staff College.

The second number of *The Hawk*, the journal of the R.A.F. Staff College, will be published on Dec. 6. An Air Ministry Order states that the primary object of this journal is to provide a medium whereby interesting and useful material produced at the Staff College may be circulated for the information of the Service as a whole. The secondary object of this journal is to record changes, developments and

FOR THE R.A.F.—A batch of three Hawker Tom-Tit training biplanes (Armstrong Siddeley Mongoose engines) ready for delivery to the R.A.F.—(*"Aeroplane" photograph.*)

Digitized by Google

THE HAWKER TOM-TIT.—A two-seat light training biplane fitted for fog-flying training, with a hood over the rear cockpit and a complete range of navigating instruments.—(*"Aeroplane" photograph.*)

happenings (serious or amusing) at the Staff College itself, with a view to keeping ex-members in touch with the College.

Orders for *The Hawk* (2s. 10d., including postage) should be addressed to the Editorial Secretary, R.A.F. Staff College, Andover, Hants.

Wives and Families Overseas.

A recent Air Ministry Order gives the following information regarding the admission into certain countries of the wives and families of Officers and Airmen of the R.A.F.:—

1. *'Iraq and Sudan.*—Public married quarters are not available in 'Iraq and Sudan, and therefore, when an officer or airman is posted to either of these places, his wife and/or family will not, except as provided in para. 3, be permitted to join him there.

2. *Aden and Transjordan.*—Except as provided in para. 3 below, the wife and/or family of an officer or airman serving in Aden or Transjordan will only be permitted to reside in the country in which the officer or airman is serving in the event of public married quarters, which are necessarily limited, being available. Passages at public expense will be provided for the wives and/or families of officers and airmen allotted such public married quarters.

3. Permission for the wife and/or family of an officer or airman serving in 'Iraq or Sudan, or of an officer or airman serving in Transjordan, who cannot be accommodated in married quarters, to join the officer or airman, may be given on the following conditions:—

(i) That the approval of the air or other officer commanding, 'Iraq, Middle East, or Aden, as appropriate, is obtained in each individual case. This approval will not be given unless the air or other officer commanding is satisfied that accommodation suitable for an officer's or airman's family is available. (ii) That all expenses, including passage both ways, are borne by the officer or airman concerned. (iii) That the officer or airman will not be eligible for any local allowances of any kind in respect of his wife and/or family; but, provided that they are not accommodated at public expense, he will continue to draw such allowances (if any) at home rates as he would have been entitled to had they not proceeded to join him. (iv) That any arrangements made cause no additional expense directly or indirectly to the public.

4. If an officer or airman is posted direct from the United Kingdom to 'Iraq, Sudan, Aden, or Transjordan, and is then, at the conclusion of his tour of duty in those places, posted to another station abroad where public married quarters are available for him, passages will be admissible under the conditions of K.R. and A.C.I.

No. 22 Squadron Re-Union.

The first re-union dinner of "Twenty-Two" Squadron, R.F.C. and R.A.F. Old Comrades' Association, will be held at the Old Red House, 94-100, Bishopsgate, E.C., on November 23, after a meeting of the Association, which is called for 17.00 hours on that date. The Old Red House is about two minutes from Liverpool Street Station. Dress will be lounge suits.

The Secretary hopes that those who have "Twenty-two" Song-books or interesting photographs of the Squadron will bring them along.

Application for tickets should be made to the Secretary, C. F. Davis, St. Thomas's Square, Salisbury, before Nov. 9.

H.M.S. "Engadine."

The Eleventh Annual Re-union of those who served in H.M.S. *Engadine* will be held at the Adelphi Hotel, John Street, Strand, on Saturday, Nov. 9, at 6.30 p.m. Dinner 6s. 6d. Particulars from Arthur B. Ward, 135, Burbage Road, Dulwich, S.E.21.

EXPANSION AT OXFORD.

On Nov. 2 the new Lecture Hall of the Oxford University Air Squadron was officially opened by the Secretary of State for Air, Lord Thomson of Cardington, in the presence of the High Authorities of the University and of the City of Oxford.

The Squadron is well provided with housing room, for, before acquiring this new hall, it already had a large shed which is practically an ordinary aeroplane hangar in which is the material from which the members of the Squadron

WESTLAND

WESTLAND AIRCRAFT WORKS

Where the Westland Wapiti is Built.

The upper illustration shows part of a line of Westland Wapiti fuselages in the main erecting shop at the Westland Aircraft Works at Yeovil. The fuselages travel along the assembly line on arrival from the fuselage shop and at each stage additional parts are added. At the end of the line the machines are fitted with undercarriages and go forward for rigging and the fitting of engines. The second photograph shows a portion of the wing covering shop where the fabric is applied to the wood or metal frames. Irish linen fabric is used and after the wings are taped and covered the external wing fittings are added, including the Handley-Page Automatic Slot Gear.

get their technical education. This material includes a standard Avro and a Bristol Fighter from which experience in rigging and truing-up parts is learned. There is also a Napier Lion and an Armstrong Siddeley Jaguar to show how water-cooled and air-cooled engines work. Round the room are diagrams of practically everything to do with the construction and operation of modern aeroplanes.

The New Lecture Hall will provide a quiet place for lectures, while those who are not attending lectures are operating in the hangar. Also the authorities hope to organise a library there. And it will be a social meeting-place for the members.

In opening the Hall, Lord Thomson stated that the Squadron was started in 1925 with the objects of encouraging an interest in aviation in the University, fostering aeronautical research, and leading students of the University to join the R.A.F. as a profession, just as they joined his own profession, the Army, as their work in life.

The first object had certainly been well achieved. The Squadron was up to full strength, and at the annual training at Manston 74 members were attached to the R.A.F. Of these, 64 had done solo flying, and 54 were fully qualified by the end of the period of training.

Referring to the scientific side, Lord Thomson said that doubtless greater progress would be made at Oxford in the future. So far as apparatus was concerned the Air Ministry would give all the help that it could.

As regards members of the University making careers for themselves in the Royal Air Force, he said that men of culture and imagination were wanted in the R.A.F., and the more the Service could recruit from the Universities the sooner the R.A.F. would realise the ideal of what an officer should be.

Taking them all round, he said that the results reached by the Squadron had been very satisfactory, and he would like to recognise the foresight and vision shown by the authorities of the University of Oxford as a venerable body which was giving encouragement to something which was very new.

He said that there was that day in Oxford a very distinguished man, General Smuts, who more than any other one man might rightly be said to have been the begetter of the Royal Air Force as an independent arm. General Smuts years ago foresaw the possibilities of an independent Air Force, and coined the phrase "The *terra incognita* of the air." General Smuts was one of the best examples of a combination of the philosopher and the man of action. That was exactly the type of man the R.A.F. needed, and he hoped that Oxford would supply that type in increasing measure.

For the benefit of the younger generation one may here remark that General Smuts, who was a lawyer with high academic distinction, became one of the leaders of the Boer Army in the War of 1900 and thereabouts. After that War he became an active citizen of the British Empire. He fought in East Africa, alongside his old leader General Botha, against the German Forces in that area. Later he came to England, and, as an intimate friend of Mr. Lloyd George, he was given the task of weighing the evidence for and against the institution of an Air Force as a separate third Service.

This report, the result of the weighing of evidence in his keen legal brain, was presented with legal precision, and undoubtedly had very great influence in persuading the Cabinet of the period to create the Royal Air Force. In this report he perpetrated that remarkable oxymoron which Lord Thomson quoted.

After Lord Thomson had duly declared the new hall open the company were entertained to tea by the Squadron in the new hall and in the big hangar.

Among the high personages of the University present were the Vice-Chancellor (Dr. Holmes Dudden), the Registrar, the Principal of Hertford, the Warden of Wadham, the Rector of Exeter, the Senior Proctor and the Censor of Non-Collegiate Students. The civic authorities were represented by the Mayor, Mr. J. T. Button. The Royal Air Force was represented by Air Marshal Sir Edward Ellington, Air Commodore Bowhill, Group Captain Gossage, and Group Captain Rathborne.

The University as a whole and the University Air Squadron in particular are to be congratulated on this latest addition to the University premises. Perhaps its architecture does not blend happily with that of the older Colleges, but it will serve its purpose admirably.

Wing Commander A. G. R. Garrod, M.C., D.F.C., M.A., who commands the University Air Squadron, deserves to be heartily congratulated on having acquired even this small addition to the amenities of the Squadron. But even more does he deserve congratulation on the progress which the Squadron has made under his command. Nothing could better indicate the position of the Squadron in the scheme of things than the presence at this little ceremony of so many representatives of all that is best in the University and in Service Aviation.—C. G. G.

SPORT IN THE R.A.F.

Sandhurst v. Cranwell.

The annual Rugby Football match between the Royal Military College, Sandhurst, and the Royal Air Force College, Cranwell, will be played at Sandhurst on Nov. 9 at 14.45 hours.

All Rugger enthusiasts who are not themselves playing on that day should make a special effort to go to Sandhurst to see this game.

Boxing.

The Sir Charles Wakefield Boxing Tournament for R.A.F. Novices was held at Henlow Camp on Oct. 30 and 31:—

The points scored in the three divisions were as follows:—

Officers:—Digby (holders), 25 points; Netheravon, 17; Sealand, 16; Henlow, 13; Upavon, 8; Farnborough, 6; Eastchurch, 6.

Airmen (Open):—Halton (holders), 33 points; Henlow, 31; Uxbridge, 25; Manston, 20; Cranwell, 11; Netheravon, 10.

Airmen (Junior Competition):—Digby, 39 points; Worthydown, 34; Gosport, 31; Eastchurch (holders), 25; Martlesham Heath, 23; Andover, 20; Calshot, 19; Upavon, 18; Sealand, 18.

OXFORD UNIVERSITY AIR SQUADRON.—Lord Thomson, Secretary of State for Air, after opening the New Lecture Hall of the Oxford University Air Squadron on Nov. 2 in the presence of the Higher Authorities of the University and of the City of Oxford.

The Daily Telegraph report of the Tournament states:—

How full-blooded was the boxing will be realised by the fact that of the first ten bouts five ended in the knock-out and two were stopped by the referee. One of the hardest punchers was L-AC. O'Connell (Calshot), a middle-weight, who, though shouldering an enormous handicap in the matter of height and reach, had AC. Cattell (Worthydown) down several times.

Not in one of the twenty-five finals was there the least disposition to play for safety. It was not that it was just blatant fighting. What was pleasantly surprising was that the majority of the competitors had a nice appreciation of the value of straight punching. Further, most of them were not afraid to speculate in their right hand.

Plt. Off. Hilliar (Netheravon) quickly saw in his bout with Plt. Off. Sayers that his opponent had no sort of guard to keep out a left hook, and, employing it to the full, he won by a knock-out in the second round, so that his station took middle-weight honours.

Plt. Off. Grant (Digby), in the officers' welters, outpointed Plt. Off. Slocum (Sealand), and we saw Plt. Off. Williams (Digby's heavy-weight) knock-out Plt. Off. Hardy (Henlow). Both were magnificent specimens of manhood. Hardy was the taller, and, I thought, the heavier of the two. Williams set up such a high pace and punched with such devastating power that Hardy was overwhelmed. What defence he was able to offer, Williams broke down ruthlessly. Hardy was floored four times, and once was punched through the ropes.

The results of the finals were:—

JUNIOR DIVISION.

Fly-weight.—AC. Clementson (Worthydown) w.o. AC. Lewis (Martlesham) unfit.

Bantam-weight.—AC. Graham (Martlesham) beat AC. Davis (Andover) on points.

Feather-weight.—AC. Cash (Worthydown) beat Cpl. Davy (Calshot), the Referee stopping the fight in the first round.

Light-weight.—AC. Welch (Gosport) knocked out AC. Millborrow (Eastchurch) in the second round.

Welter-weight.—AC. Mosscrop (Digby) beat AC. MacFarlean (Sealand) on points.

Middleweight.—AC. Haden (Digby) knocked out AC. O'Connell (Calshot) in the first round.

Light-Heavy-weight.—AC. Ridout (Digby) beat AC. Cattell (Worthydown), the Referee stopping the fight in the second round.

Heavy-weight.—AC. Stoneman (Gosport) knocked out Sjt. Coote (Upavon) in the second round.

OFFICERS' DIVISION.

Feather-weight.—Plt. Off. Purcell (Digby) beat Flg. Off. Owen (Upavon) on points.

Light-weight.—Plt. Off. Nobleston (Netheravon) knocked out Plt. Off. Ashton (Henlow) in the first round.

Welter-weight.—Plt. Off. Grant (Digby) beat Flg. Off. Slocum (Sealand) on points after Slocum had been cautioned for holding.

Middle-weight.—Plt. Off. Hilliar (Netheravon) knocked out Plt. Off. Sayers (Sealand) in the second round.

Heavy-weight.—Flg. Off. Williams (Digby) knocked out Flg. Off. Hardy (Henlow) in the first round, the Referee stopping the fight.

SENIOR DIVISION.

Fly-weight.—AA. Keast (Halton) beat AC. Davis (Uxbridge) on points.

Bantam-weight.—AC. Statery (Uxbridge) knocked out AA. Booth (Halton) in the second round.

Feather-weight.—AA. Hughes (Halton) beat AC. Robinson (Henlow) on points.

Light-weight.—AC. Herlihy (Uxbridge) beat AC. McKie (Henlow), the Referee stopping the fight in the third round.

Welter-weight.—AC. Lowater (Henlow) beat Cpl. Collishaw (Manston) on points.

Middle-weight.—AC. Thoroughgood (Manston) w.o. AC. Storry (Cranwell), injured.

Light-Heavy-weight.—AA. Grover (Halton) beat AC. Simmonds (Henlow), the Referee stopping the fight in the second round.

Heavy-weight.—AC. Stentiford (Halton) knocked out AC. Pringle (Henlow) in the second round.

Swimming in 'Iraq.

The R.A.F. ('Iraq) Swimming Championships were held at Hinaidi on Sept. 25 in the presence of Air Vice-Marshal Sir Robert Brooke-Popham and a large number of enthusiastic spectators.

The officials were:—Referee and Starter: Flt. Lt. V. G. A. Bennett; Judges: Sq. Ldr. G. Stevens, O.B.E., Sq. Ldr. J. W. Woodhouse, D.S.O., M.C., and Flt. Lt. E. S. C. Davies; Timekeepers: Flg. Off. O. H. D. Jackman (Hon. Secretary of the Association in 'Iraq) and Flg. Off. S. R. Sherman; Whips: Flg. Off. P. McK. Terry, Sjts. McCombe and Abbinnett; Recorders: Flt. Lt. G. T. H. Pack, Cpls. Robinson and Currie; Water Polo Referee: Flt. Lt. V. G. A. Bennett; Press Representative: Sjt. J. Chart.

The winners of the various events were:—

100 *Yards Free Style*: AC. Cherriman, No. 70 (B) Sqdn. (1 min. 10 2/5 sec.).

100 *Yards Breast Stroke*: AC. Hood, "D" Sqdn. (1 min. 30 2/5 sec.).

220 *Yards Free Style*: AC. Cherriman, No. 70 (B) Sqdn.

Inter-Unit Relay Race: No. 70 (B) Sqdn. (3 min. 8 sec.).

100 *Yards Back Stroke*: Cpl. Hedges, No. 203 (FB) Sqdn. (1 min. 33 1/5 sec.).

Diving Championship: Sjt. Jones, No. 55 (B) Sqdn.

440 *Yards Free Style*: Cpl. Meagor, No. 70 (B) Sqdn. (7 min. 14 sec.).

Plunging Championship: AC. Penney, A.C. Reserve (distance, 59 ft. 11½ in.).

Water Polo Final: No. 70 (B) Sqdn 2, "B" Depot Sqdn. 2. The teams were: *No. 70 (B) Sqdn.*—AC. Soper, AC. Board, Flt. Lt. Davies, AC. Cherriman, AC. Rees, Cpl. Meagor and AC. Robertson; *"B" Sqdn.*: AC. Munns, AC. Gavin, AC. Gilbert, AC. Jenkins, AC. Valentine, AC. Warren and AC. Saffery.

The final placings for the Command Cup were No. 70 (B) Sqdn., 35 points; A.C. Reserve, 21 points; "D" Sqdn., 6 points; No. 203 (FB) Sqdn., A.C. Wing, and No. 55 (B) Sqdn., 5 points each; "C" Sqdn., 4 points.

The following cups won during the season were then, together with the remaining prizes, given away by Air Vice-Marshal Sir Robert Brooke-Popham, K.C.B., C.M.G., D.S.O., A.F.C., President of the R.A.F. ('Iraq) Swimming Association:—*Command Championship Cup*, No. 70 (B) Sqdn.; *Hinaidi Water Polo League Cup*, No. 70 (B) Sqdn.; *Aggregate Cup*, No. 70 (B) Sqdn.; *Inter-Unit Relay Race Cup*, No. 70 (B) Sqdn.

BOXING NOVICES.—A group of the competitors in the Contests for Novices for the Sir Charles Wakefield Trophies, at Henlow Camp, on Oct. 30 and 31.

FUTURE SCHNEIDER TROPHY CONTESTS.

The Air Ministry announces:—

The Government have had under review the future policy in regard to the Schneider Trophy contest in 1931 and subsequent years. After careful consideration, it has been decided that a Royal Air Force team will not again be entered, thus leaving British participation to private enterprise under the auspices of the Royal Aero Club.

Two main considerations influenced this decision:—

(1) That, owing to Government participation in recent years, the contest has assumed a character not in accordance with the intentions of M. Jacques Schneider, its originator and the donor of the Trophy.

(2) That, although the entry of a Royal Air Force team was calculated to give a much-needed impetus to the development of high-speed aircraft—and did so notably in the two latest contests—sufficient data have now been collected for practical development in this direction, and the large expenditure of public money involved by Government participation is, therefore, no longer justifiable.

This decision should not, of course, affect the entry of British machines in future contests. Convincing proof has now been furnished of what the British aircraft industry can do, and the wide public interest displayed should make it possible for our pilots and machines to compete in what is intended to be a sporting International event on a basis of private enterprise.

A Comment.

This announcement is particularly interesting in view of the statement made by the Prime Minister, Mr. Ramsay MacDonald, in the s.s. *Orford*, after the Schneider banquet on Sept. 7, when he said quite definitely "we are going to do our level best to win again."

In all the history of England there has probably never been a politician or statesman who as an individual is more scrupulously honest and truthful than is Mr. MacDonald. Therefore nobody can imagine that when he used that phrase he meant anything else. The only difficulty is to tell what he did mean.

The pronoun "we" may have meant the British Nation, or it may have meant *any* British Government, or it may have meant the Labour Party only, or it may have meant the Air Ministry, or it may have meant simply those of us who were assembled in the s.s. *Orford* at that moment. Anyhow, the Air Ministry has evidently made up its mind for Mr. MacDonald and is not going to play any more.

With its first reason none can argue. But its second reason is sheer nonsense worthy of the worst type of reactionary English technical man. Actually there are good reasons for not competing for the Schneider Trophy under existing conditions. And there are dozens of reasons why the Air Ministry should not compete.

The contest certainly is not at all in accord with the intentions of the late Mr. Jacques Schneider. The types of aircraft which have been developed owing to the deliberate twisting of the rules are nothing at all like seaplanes.

The original rule said that the Contest was to be flown over the open sea. And it never has been flown over the open sea. It has always been flown over land-locked water, or over comparatively sheltered bays. And the qualifying tests have always been done on protected water.

On the other hand, the existence of this competition has spurred the different nations on to produce machines which have travelled at speeds which would never have been reached on ordinary land machines.

There is no aerodrome big enough or smooth enough to allow an aeroplane to get off and alight as these Schneider machines do off and on water. And whatever scientists may calculate about the possible speeds of those same machines if they had wheels instead of floats or if they had retractable under-carriages, the only thing which cuts any ice in an argument with non-aeronautical people is the actual speed which has been done by an existing aeroplane with a man in it.

Therefore we may all be justifiably convinced that what has been done up to the present has been well worth while in the interests of aviation in general. And the results of the last Contest have been particularly well justified for British aviation in particular, for we can now tell the world that not only *can* we make but we *have* made the fastest aeroplanes in the world besides having, ever since the beginning of aviation, made the best aeroplanes in the world judged purely by material and workmanship.

On the other hand, the idea of governments ever taking a hand in a contest of this kind is altogether wrong. Poor Jacques Schneider put up his trophy to encourage the improvement of aircraft. And the competition was always between manufacturing firms of one nation and of another until the U.S. Navy stepped in and made a government affair of it.

In a good many contests although trade firms competed, the cost was practically borne by one individual. For example when we won the second Contest at Monaco Mr. T. O. M. Sopwith practically paid for the whole thing out of his own pocket, because he was the sole proprietor of the Sopwith Company. And in the same way when the Supermarine Company won the Trophy at Naples in 1921 Mr. Hubert Scott-Paine practically paid for the whole thing.

When the U.S. Navy came in on the game naturally the other players had to call for more money to back their hands. And so the Italian Government and British Government came in on it. And now very likely the time has come when governments should cut out of the game and leave it either to rich manufacturers or rich sportsmen.

Regular readers of The Aeroplane know that personally one has no particular respect for the rich sportsmen or the rich manufacturers of this country, because although the list of patrons of the Royal Aero Club has at one time or another included a good many millionaires, not one of them, with the exception of Sir Charles Wakefield, has ever put his hand in his pocket for the good of the sport of aviation or for the good of the advancement of our aeronautical prestige.

In the first Schneider Contest after the War several manufacturers did take a hand, including the Supermarine Company, the Avro people, the Fairey Company and the Hawker Company. After that the Supermarine people were the only firm to build machines for which the Government did not pay. And in land contests the Gloster people were the last to compete in any big International speed event.

Thus, as may be seen, the trade has competed in our sole remaining classic event, and the Air Ministry has competed, and one quite agrees that the time has now come when rich sportsmen ought to compete in it.

With the work that has already been done by the Government and by the trade, any well-to-do sportsman ought to be able to put up a couple of Schneider racers the next time our possession of the trophy is challenged at no more cost to himself than if he had taken it into his head to run a horse-racing stable in that particular year.

People think nothing of giving £10,000 or £20,000 for a horse which does not win the Derby or any other big race, and a stable full of decent horses cannot well cost less than £100,000 in the year, what with buying the horses and paying for their keep and training and so-forth. Two or three Schneider racers complete with pilots and mechanics ought to cost a good deal less.

In this connection the United States seem to have set us an example as they have done so often. The U.S. entrant this year, which did not appear, the Mercury monoplane built for Lieut. Alford Williams, U.S.N., was actually built and paid for by a syndicate of rich young American sportsmen,—of whom one happens to know two personally. Now that our Government has backed out, the chances are that the same syndicate will challenge us for the possession of the Trophy two years hence. So somebody had better start forming a defending syndicate in this country right now.

The second paragraph in the Air Ministry's announcement is typical of the Government scientist. The man who could say "sufficient data have now been collected for practical development in this direction" ought to be made either an Admiral in the Navy or a Senior Permanent Civil Servant at once. Self-sufficiency at any time is bad enough, but national self-sufficiency can only be taken as a sign of incipient cerebro-sclerosis—otherwise hardening of the brain. The truth is that under no circumstances can we ever hope to collect enough data on any subject under the sun to say that we have all we want for practical development of any kind.

The phrase "convincing proof has now been furnished of what the British Aircraft Industry can do" is very nearly as soul-destroying. If that phrase should be taken seriously by the British Aircraft Industry, it would simply mean that on the strength of what the Supermarine Company have done every other firm in the industry could sit back and say to all the foreign nations "we make the finest products in the world, and if you are good we don't mind selling some to you."

That is the favourite attitude of the British manufacturer in every line of business, and that is why the Americans have practically the whole trade of the World in so many industries in which we could excel if, as the Prince of Wales said, our business men were as good as our workmen.

That last sentence ought to have read "One firm in the British Aircraft Industry has produced one aircraft which succeeded in beating an Italian team of two unflyable aeroplanes and one two-year-old aeroplane. The winning aeroplane was very good as was proved by its beating the world's speed records afterwards. And now, if the British Aircraft Industry wants to make the best of the advertisement which Government money has won for it, it must either find the money itself or find some sportsmen to pay for it." In other words, as Mr. Churchill said years ago, "British Civil Aviation must fly by itself." That would have been a thoroughly sound attitude for the Air Ministry to take.—C. G. G.

A MORRIS AERO-ENGINE.

A year or more ago we of The Aeroplane heard on quite good authority that Sir William Morris of Morris Motors Ltd. was seriously considering coming into the aircraft business and showing how to produce a cheap and reliable aero-engine.

A good many months ago, before anybody except the inner circles of aviation were talking about it much, we knew for a fact that at a moment opportune in his judgment Sir William Morris would produce an aero-engine. Since then rumours to that effect have appeared in print, so The Aeroplane may as well say definitely that sooner or later there is going to be a Morris aero-engine.

What it is to be is not known. Possibly Sir William Morris himself has not yet made up his mind what his production type is going to be, though probably by this time he has two or three different types being constructed in his experimental shops.

Knowing something of Morris methods, and assuming that Sir William made up his mind definitely six months ago to build an aero-engine, the probability is that he has three or four experimental engines actually running on the bench at the moment,—seeing that the average British car manufacturer takes about two years to do what the Morris people do in six months. The one thing definite is that Sir William's intention is to build, first of all at any rate, a production engine for light aeroplanes.

That does not necessarily mean light aeroplanes within the limitations imposed for competition purposes by the *Fédération Aéronautique Internationale*. It merely means a thoroughly reliable engine at a price which will reduce the cost of aircraft for private owners, and will give plenty of power for its weight.

The average Moth and the average Avian is well over the weight imposed by the F.A.I. competition limits, and none of our so-called light aeroplanes are orthodox light aeroplanes except those which are too small to be practical transport vehicles. Therefore an engine which is a bit bigger than those which are at present in use will be quite a good proposition provided that the price is right. And that of course is exactly where the Morris people are bound to score.

What Type?

Obviously for such a job the engine must be air-cooled. Nobody is going to bother with the extra expense and weight of radiators, with all their attendant plumbing, on a low-priced light aeroplane. So the choice of a type lies between the radial, the in-line upright, the in-line inverted, the Vee upright, the Vee inverted, and the flat double-opposed, either four-cylinder, six-cylinder or eight-cylinder.

Personally if one had all Mr. Morris' resources at one's disposal one would put in hand a six-cylinder inverted in-line engine as an experiment and one would start on a radial of 120-150 h.p. for immediate production. And in the meantime one would keep more than half an eye turned on the development of swash-plate engines such as the Redrup and the Turner.

One is not making bets on the subject, but if a radial appears as the first Morris aero-engine readers of The Aeroplane need not be surprised.—On the other hand, if something else appears they need not be surprised either.

A Revolution.

Naturally everybody in the Aircraft Industry has been talking about the Morris move for the last few months. Optimists have said that the Morris aero-engine is going to come very near The Aeroplane's ideal of 100 h.p., 100 lbs., £100.

A better proposition now would be 125 h.p., 125 lbs., £100. But if the engine works out at 125 h.p., 200 lbs., and £150 it will still be quite good enough to revolutionise the Aircraft Industry. For, mark you, such an engine does not represent merely one good engine for one good aeroplane. It means that two of it can make a very nice twin-engined job and four of it in tandem pairs can be made just about as good an air-line proposition as anybody is likely to want for a while.

The Critics.

The pessimists, or the anti-Morrisites, have expressed frank disbelief in the idea that Sir William Morris is going to do for the Aircraft Industry what he did for the Motor Trade.

They say that turning out cheap motor-cars which will stand up to pretty good hammering on the road is a job very different from making aero-engines which will stand up to the Air Ministry's type-tests. And they say that even if the first Morris aero-engines pass their type-tests the Morris organisation will find that turning out motor-cars up to their own self-imposed standards will be a very different thing from turning out aero-engines up to the standard imposed by Air Ministry calculations and the demands of the Aeronautical Inspection Department.

Personally one can see nothing in this argument. If the engine passes its type tests Air Ministry calculations count for nothing. And so far as the A.I.D. are concerned one has always found them extraordinarily helpful. They will not pass anything which ought not to be passed, and they are amazingly useful in pointing out ways and means of improving things. In fact a good A.I.D. staff in a factory is the equivalent of having a staff of good consulting engineers at a very low price. The people who have trouble with their A.I.D. personnel are either the people who turn out bad work or the people who do not know how to deal with Government officials.

Some of these critics say that the Morris engine cannot be produced cheaply because it will have to stand the cost of all this Government inspection which Morris cars do not have to stand. Personally one believes that when the Morris engine gets going the output will be so great that the cost of Government inspection will be negligible.

One of the chief troubles in the Aircraft Industry is that so few people have ever laid themselves out from the start for cheap production. People are apt to think that cheap production means mass production. It does not mean anything of the kind. A small output of an article which is designed to be produced cheaply may mean a very much lower price than a huge output of things which are produced in mass but are not designed to be produced cheaply. Morris cars happen to be examples of mass production and cheap production at the same time.

Standing Up To It.

Other critics have said that making a cheap motor-car engine is an easy job compared with making an engine which will stand up to use in an aeroplane. Personally, as a fairly good average rule-of-thumb engineer, one believes that that argument is nonsense.

There is truth in the statement that aero-engines run for longer periods without overhaul than do motor-car engines. But then aero-engines do not have to run in an atmosphere of dirt and mud which either clogs them up or acts as a grinding material and wears them out.

There was a time when aero-engines were called upon to run at full throttle the whole time they were in the air, but that was years ago. The first thing that a pilot is taught in these days is to throttle down and run his engine at cruising speed when once he has reached the height at which he intends to fly. None of our modern aero-engines run at anything like the revolutions per minute that car engines do. And that is one reason why car engines wear out quicker. Judging by one's own experience of Morris cars the Morris aero-engine ought to be rather a startling product.

Some few months ago one took a six-cylinder Morris saloon up to Manchester and back. One had never driven a Morris before and the roads were half wet and half dry, so naturally one went warily. But that car did 120 miles in the first three hours without hurrying. After that, going through the Potteries, in a howling gale and a downpour of rain, we had to slow down, but, having left London after 08.30 hours we were in Manchester for lunch at 13.30.

Coming back the following day that little six-cylinder engine took the saloon up to Buxton and over the Derbyshire hills on top gear without any trouble. And on a fine Sunday afternoon, with the usual Sunday afternoon drivers cumbering the road, it put up an amazing performance. One did not check the exact time and distance, but we were certainly having tea in Lutterworth at 18.00 hours and we were certainly disembarking luggage at Kensington at 20.00 hours, and the distance from Lutterworth to London is not much short of 90 miles.

That engine was the most perfectly balanced piece of mechanism one has ever driven. Running fast or running slow it never quivered. It was more like driving a clock than any kind of internal combustion engine.

There seems every reason why a Morris aero-engine should be equally beautifully balanced and equally capable of keeping up high revs. for hours at a stretch.

Designers and constructional engineers and machinists who are accustomed to doing work of that kind are not going to be particularly embarrassed by having to turn out aero-engines which, although lighter per horse-power, are not called upon to give very much more power for their volume.

When?

When we may expect to see the first Morris aero-engines is another question altogether. One does not profess to know whether the first engine will pass its type tests next week or next Spring or next Autumn.

In his motor-car business Sir William Morris has shown not only that he has a genius for gauging the needs of the market, but also that he has the driving power needed to meet those needs at the right moment, instead of doing what so many English manufacturers in all lines of business do, namely, playing about altering patterns until somebody else has got the market. And reasoning purely along those lines, the Morris engine ought to be on the market well within the next twelve months.—C. G. G.

CREDIT WHERE DUE.

Various readers of The Aeroplane seem to be rather puzzled as to whether the credit for the performance of the twelve Jupiter engines in the great Dornier flying-ship Do.*x* should be given to British or German designers and constructors. Therefore an explanation seems fitting.

The position is that when the Bristol Aeroplane Co. Ltd. produced the highly successful Jupiter engine, the *Société des Moteurs Gnôme et Rhône,* of Paris, acquired the licence for the sale and construction of Jupiter engines to Bristol designs for the whole of the Continent of Europe with the exception of Scandinavia.

The result is that most of the Jupiter engines in use on the Continent have actually been built in France. But certain European Governments who desired to have their Service engines built in their own countries, for strategic reasons, have acquired sub-licences from the Gnôme-Rhône Co. Consequently Jupiter engines are being built under licence to the Gnôme-Rhône Co. in Germany, Italy, Czechoslovakia, Yugoslavia, Hungary, Switzerland, and Belgium. Some of these countries have not yet produced any engines which have flown.

Therefore, where the Do.*x* is concerned, the credit belongs to Bristol design plus German material and workmanship.

There is a story about the first launching of the great Dornier Do.*x*. with her twelve Jupiter engines which seems to be new to so many people right on the inside of aviation that it will probably be new to the majority of readers of this paper.

When the Do.*x* was about to do her first flying trials an enterprising London paper sent a photographer with a pilot in a light aeroplane to Friedrichshafen to get good pictures of the Do.*x*. in the air. As the engines were being started up for her first flight the light aeroplane went up and cruised round, ready to dive on the lumbering monster and get some good close-up pictures. As soon as the wake on the water showed that the Do.*x*. was getting under way the pilot of the light machine put his nose down after it. The Do.*x*. got off the water and the light machine dived after it with the engine wide open. But, to the photographer's annoyance, instead of getting a close-up of the *Do.x*. he could only get a further-away. The harder the light machine dived the further the Do.*x*. flitted, so the photographer gave it up in disgust.

After they had landed, and after the Do.*x*. had come home, they were informed that the big machine had taken off quite comfortably, with only eight engines running out of the twelve, and was cruising very nicely at 120 m.p.h.,—which is a little more than any of our best light aeroplanes can do at the moment.

In this connection our Mr. G. D. makes the brilliant suggestion that the three-engine enthusiasts, who are for ever preaching that three engines are the salvation of aviation in that they give complete insurance against forced landings, ought to buy a Do.*x*. from Dr. Dornier, take out the twelve Jupiters, and put in three Rolls-Royce R. engines of the type used in the Schneider Supermarine S.6s. As a matter of fact they would give just about the same amount of power. The suggestion is offered without hope of reward to the three-engine cranks at the Air Ministry.

AMERICAN COMPETITION ON THE CONTINENT.

The many people who inspected and admired the Ford Trimotor monoplane (three Pratt and Whitney Wasp engines), which was shown at Olympia in July, will be interested to hear that this machine has now been sold to the Ministry of Public Works of Czechoslovakia. Mr. Leroy Manning, the chief test pilot of the Ford Motor Co., who has flown the machine all round Europe, says that it is to be used on the Czechoslovakian air line between Prague, Uzhorod, and Bucharest.

The conditions of sale were that the machine should prove itself capable of the performance which was advertised at Olympia. These figures were all exceeded, and the ship has now been officially accepted.

Prior to doing these acceptance tests the machine was demonstrated in the following cities, in the order given: London, Paris, Cologne, Berlin, Koenigsberg, Danzig, Riga, Smolensk, Moscow, Warsaw, Posen, Dessau, Travemunde, Copenhagen, Malmo, Rotterdam, Amsterdam, Manchester, Brussels, Antwerp, Geneva, Zurich, Friedrichshafen, Munich, Prague, Vienna, Belgrade, Budapest, Bucharest, Constantinople, Sofia, Salonika, Athens, Brindisi, Naples, Rome, Venice, and Milan.

Several of the bigger cities were visited two or three times during the Summer. The total distance covered was 8,915 miles between the various cities. Besides this, 3,757 passengers were carried on demonstration flights.

Mr. Manning and his crew will go back to America with a high opinion of European weather. During the whole of that trip they were only delayed by bad weather for four hours. They had no mechanical difficulties whatever to interfere with their schedule. The engine was not overhauled, but one cylinder had to be changed. No work was done on the machine itself except for the changing of one tyre. With those exceptions, all the work done was routine cleaning, inspection, and service.

Of course, compared with our British air-line machines the Ford Trimotor does not carry anything like the load for its horse-power. It carries fewer passengers, and it has neither the capacity nor the weight-lifting ability to carry as big a load of baggage or freight. On the other hand it is a great deal faster than any of our machine, and it is certainly more comfortable to sit in. So the buyer of aircraft merely has to pay his money and take his choice.

On the other hand, no big British air-liner has been sent on a tour of Europe with the idea of selling more of its type to Continental buyers. And no British air-liner has been built to compete with the Fokker and the Ford and similar American-built ships. So we cannot blame our Czechoslovak friends for not bothering to "Buy British."

—C. G. G.

THE GOVERNMENT AND AERODROMES.

In the House of Commons, on Oct. 29, in reply to a question by Mr. Louis Smith, the Under-Secretary of State for Air said that grants had been made in certain cases by the Unemployment Grants Committee in connection with work on municipal aerodromes.

As regards the encouragement of flying clubs, some of the subsidised clubs had decided to become affiliated to National Flying Services, Ltd., and would thus benefit from the grants made to that organisation when they ceased to be eligible for the existing subsidy. It was hoped that others would be self-supporting by the time that their present agreements with the Air Ministry came to an end.

ITALY AND THE SCHNEIDER TROPHY.

A Central News message from Rome dated Nov. 2 says that Italy's official participation in future Contests for the Schneider Trophy is unlikely. The Italian Aero Club will be free to organise the Italian entries for such contests.

The message goes on to say that private firms such as Fiat, Isotta Fraschini and Caproni are quite competent to provide entries for such Contests and that there is a satisfactory supply of private pilots.

Some think, however, that only Governments can foot the enormous bills run up by the Schneider Trophy and if the piper is not paid he plays no tunes.

HERE WE ARE AGAIN.

M. Lawrence Santoni, whose name will be remembered as one of those connected with the pre-War British Deperdussin Company, and since the War with the Italian Savoia and the French C.A.M.S. companies, has formed a company known as the *Compagnie Internationale de Taxis Aériens et d'Aviation Légère.*

The objects of the company are to organise and to operate aerial taxi services, construct, sell, and act as agents for light aircraft, operate garages and service stations for light aircraft, etc.

Among the well-known names associated with the organisation of the company are MM. Louis Bleriot, Sadi-Lecointe and Faillant.

A SAUNDERS-ROE APPOINTMENT.

A new accession to the technical staff of Saunders-Roe Ltd. is Flt. Lt. S. D. Scott, R.A.F. (symbol E). Flt. Lt. Scott was a pilot of the Far East Flight, R.A.F., and Technical Officer responsible for the maintenance of the aircraft and engines of the flight between overhaul bases.

Before joining the Service he was with leading engineering firms in the capacity successively of fitter, tester, draughtsman, and engine-inspector. The firms included Acer Ltd., and Napier and Sons Ltd., J. I. Thornycroft Ltd., Bristol Tramway and Carriage Co., Wolseley Motors Ltd., Austin Motor Co. Ltd., Vauxhall Motors Ltd., Lanchester Motors Ltd., and Clement Talbot Ltd.

Later he was fitter and tester at the R.A.F., Farnborough, and engine examiner in the A.I.D.

In May 1916 he was a Flight Sub-Lieutenant, R.N., and was later posted as seaplane instructor to Calshot. He was promoted to Flight-Lieutenant, R.N., in the following year and became Chief Instructor at Lee-on-Solent, and was again promoted to Flight-Commander, R.N. Late in the year he was commanding No. 10 Group, Repair Depot, Calshot, and in April of 1918 became Captain, R.A.F. He commanded the R.A.F. Seaplane Station, Torquay, in 1918 and 1919. He left the R.A.F., but rejoined in 1922 with a short-service commission.

From 1922-1926 he was a flying instructor (seaplanes) at Calshot, carrying out the Kingston and Southampton flight trials, and making night flying-boat trials continuously. From January 1926 until joining the Far East Flight he commanded the Seaplane Training and Reconnaissance Flight at Calshot.

Flt. Lt. Scott's Service flying totals 1,700 hours, and his flying-boat experience should prove extremely valuable to Saunders-Roe Ltd.

VICKERS
(AVIATION) LIMITED

ACCESSORIES for AIRCRAFT.

Enquiries of Aircraft Constructors and Users are invited for the following specialities manufactured by VICKERS (AVIATION) LIMITED and used largely in aircraft supplied to the Royal Air Force:—

VICKERS (Patent) FUEL COCKS (Light Pattern).

VICKERS FUEL PUMPS (Hand-operated & Wind-driven).

FOOT VALVES. NON-RETURN VALVES. FUEL FILTERS.

RELIEF VALVES. FLOW INDICATORS. OIL COCKS.

VICKERS-DAVIS NAVIGATION LAMPS (Light Pattern).

GENERATING EQUIPMENT FOR AIRCRAFT LIGHTING.

VICKERS-REID CONTROL INDICATOR.

VICKERS-POTTS OIL COOLERS.

VICKERS OLEO-PNEUMATIC UNDERCARRIAGE AND TAIL SKID SHOCK ABSORBING UNITS.

VICKERS UNIVERSAL PULLEYS & GUARDS FOR LIGHT CONTROLS.

STREAMLINE WIRES AND SWAGED TIERODS.

"MALLEVILLE" ADJUSTABLE PIPE CLIPS.

VICKERS (Patent) HYDRAULIC BRAKES.

Head Office:

VICKERS HOUSE,
BROADWAY, LONDON, S.W.1.

Telephone: VICTORIA 6900.

Works: WEYBRIDGE, SURREY.

Telegrams: VICKERS, SOWEST, LONDON.

SARO
"CUTTY SARK"
CABIN FLYING BOAT.

THE Cutty Sark is designed as a cabin flying-boat suitable in every respect for commercial air-routes, private ownership, fire patrol, etc., but is readily convertible to amphibian principles.

Equipped with one, two, or three engines, the smaller model accommodates 4 cabin passengers, the larger type seating eight people. The twin or triple-engined machines fly level even with one unit out of action.

Every auxiliary is likewise produced by Saunders-Roe, the range embracing refuelling tenders, petrol and oil scows, amphibian gear, floating docks, and general servicing units.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

ROUND THE WORLD ON 20 HORSE-POWER.

On Aug. 12, 1928, the Baron von Koenig-Warthausen left Berlin in a Klemm monoplane (20 h.p. Mercedes engine), flying in an easterly direction, and on Oct. 27, 1929, he arrived at Detroit, Mich.

He has flown across Europe and Southern Asia to Singapore and from San Francisco to Detroit. He covered the intervening distance between Singapore and San Francisco by boat.

Before leaving Germany he had only about 25 hours' flying experience. He intends to continue to the east coast of the United States and return to Germany by boat.

His route was by way of Berlin, Moscow, Rostov, Baku, Teheran, Bushire, Karachi, Allahabad, Calcutta, Bangkok, Singapore, and finally San Francisco, San Diego, Tucson, El Paso, St. Louis, Chicago and Detroit.

Altogether it is an amazing flight for a comparatively inexperienced pilot on such a low-powered machine.

SWEDEN—THE CAPE.

On Oct. 25 Mr. Gosta Andree, who is well known to many aeronautical people in this country, arrived at the Cape in a D.H. Moth from Sweden. He covered the distance of 9,320 miles in 26 stages.

THE HAMPSHIRE AEROPLANE CLUB.

The flying time for the month of October was 147 hours 50 minutes, consisting of 72 hours 25 minutes dual instruction, 21 hours 15 minutes solo flying, 46 hours 15 minutes by "A" pilots, and 7 hours 55 minutes Instructor's solo and passenger-carrying.

Five new pilot-members joined the Club during the month and two of them have made successful first solo flights.

Messrs. Lipscomb, Capon, Blake, Allinson and Brownell, and Sir Robert Clayton-East have done the tests for their "A" licences.

The President, Lord Louis Mountbatten, is back in this country and is taking a course of instruction.

THE BRISTOL AND WESSEX AEROPLANE CLUB.

October weather was unkind to the Bristol Club and flying was considerably curtailed. The club expects to escape a good deal of local fog when it moves to the new Bristol Aerodrome. Lt. Comdr. P. H. G. James, R.N., and the Hon. G. E. Dutton passed their "A" licence tests.

On Oct. 4 the club held the first of the four Winter Season Dances at the Grand Spa Hotel, Clifton. It was a very cheery party, attended by over 150 members and their friends. The next dance is on Dec. 6.

All were sorry to say good-bye to Mr. L. A. Egglesfield, who has acted as Assistant Instructor for six weeks. His enthusiasm reflected itself in the keenness of members. The best of luck to him with National Flying Services.

Two machines were in commission during the month and the total flying time was 65 hours 30 minutes. This consisted of 38 hours 30 minutes with pupils (16) under instruction, 9 hours 45 minutes by soloists (6), 12 hours 15 minutes by licensed pilots (15), and 1 hour 30 minutes in passenger-carrying.

IN DEFENCE OF LYMPNE.

Mr. Dallas-Brett, Secretary of the Cinque Ports Club, writes in defence of Lympne Aerodrome as follows:—

Sir,—I cannot let your remarks on the subject of Lympne Aerodrome in page 1024 of THE AEROPLANE issue of Oct. 30th, pass without objection. Judging from your hair-raising description of this "criminal" Air Port, with its downward air-waves and vertical up-currents, an uninstructed reader might well gain the impression that any attempt to aviate in its vicinity would result in certain disaster, and remarks of this nature are calculated to do this Club a considerable amount of harm by frightening away prospective members. One would have no valid objection to the remarks if they represented the true state of affairs, but in this case they do not.

I should be grateful if you would allow me to point out to you, and your readers, especially to those of them who contemplate learning to fly at Lympne with this Club, that the aerodrome at Lympne is undoubtedly one of the very best and safest of the aerodromes used

A NEARLY-LIGHT AEROPLANE.—A Hawker Tom-Tit (120 h.p. Armstrong Siddeley Mongoose engine) taking off from Brooklands for delivery to the R.A.F. The type may soon be available for the private owner, as a vehicle in the luxury class.—(*"Aeroplane" photograph.*)

Digitized by Google

A MANX MONOPLANE.—The tail-less Soldenhoff-Langguth piloted by Herr Espenlaub, the famous glider.

by the Flying Clubs, and visiting pilots from other Clubs are continually congratulating us on being able to use it.

The surface is excellent and is kept in very fine condition. The slight slope of the ground of which you make so much is of very little account as far as light aircraft are concerned owing to the immense area of landing surface.

It is true that there is usually a bump over the edge of the cliff at a distance of between 200 and 600 yards from the Southern boundary of the aerodrome, but I should like an opportunity of assuring your readers that up to the present time, this bump is regarded purely in a friendly spirit by our members, and no member has as yet suffered the discomfiture of having the wings nearly fetched off his aeroplane!

I myself have encountered a down-draft in the neighbourhood of Lympne, but never during a period when the prevailing wind was blowing. This down-draft occurs only when the wind is in the North, and is not apparent unless the aircraft is flying low down, down-wind, and therefore does not affect take-offs.

Your remarks as to the lack of food and drink on the aerodrome are true as regards the general public, but I can assure your readers that members of this Club can obtain a limited amount of food and an almost unlimited supply of drink in our Club lounge in No. 1 hangar.

The only part of your remarks with which I heartily agree are those relating to the total lack of sanitary arrangements, which are as you so justly remark, "a disgrace to a so-called civilised community." (Signed) R. DALLAS-BRETT.

[One need only add that there is all the difference in the World between bouncing off the ground in a lightly-loaded light aeroplane with a couple of gallons of gasoline in the tank and hauling an air-taxi or an air-liner up that same hill when it has full tanks, a full cabin and a full freight-box. If such a machine unsticks in time to clear the telegraph-wires and the trees it gets a jolt from that up-current that makes it groan all over, whereas a light aeroplane merely goes up like a lift and the sensation is rather jolly.—C. G. G.]

CROYDON — THE CAPE — CROYDON.

Mr. Roy Tuckett, a member of the Port Elizabeth Light Aeroplane Club, has bought a slotted Gipsy Moth from Phillips and Powis Aircraft, Ltd., of Reading.

This machine, which is of the standard wooden fuselage type, will have an extra 20-gallon tank in the front cockpit and an extra 20-gallon tank in the rear luggage locker. Short exhaust-pipes will be fitted in the place of the usual long silencing pipe.

Mr. Tuckett will attempt to fly from Croydon to Cape Town and back. The trip will be done in stages.

AIR TOURING TO EGYPT.

The Royal Aero Club warn air tourists contemplating flights to Egypt that they should in the first instance apply to the Air Ministry, who will take the necessary action to secure from the appropriate Department permission for flights to Egypt.

Application should *not* be made direct to the Egyptian authorities.

A NEW GLIDING RECORD.

A new gliding record has been established at Rhön-Rositten by Lt. Dinor of the Ortelsburg Jaeger battalion who remained in the air for 14 hrs. 44 min. This flight is claimed to have exceeded by 35 minutes the record established in 1927 by the late Ferdinand Schultz.

Most of Lt. Dinor's flight was done during the night as he took off in the early afternoon and landed the following morning.

FRANCE—MADAGASCAR.

On Oct. 27, MM. Goulette, Marchesseau, and Bourgeois who left Paris in a Farman F.91 cabin monoplane (230 h.p. Salmson air-cooled engine) on Oct. 17 to fly to Madagascar, arrived at Antananarivo.

They completed the journey in ten stages, as follows: Le Bourget—Las Alcazares (1,400 kms.); Los Alcazares—Ksabi (950 kms.); Ksabi—Adrar—Reggan—Tanezrouf (950 kms.); Tanezrouf—Gao—Niamey (1,150 kms.); Niamey—Zinder (860 kms.); Zinder—Fort Lamy—Fort Archambault (1,300 kms.); Fort Archambault—Bangui—Coquilhatville (1,000 kms.); Coquilhatville—Leubo—Kanda-Kanda (1,050 kms.); Kanda-Kanda—Elizabethville (750 kms.); Elizabethville—Broken Hill—Quilimane (1,450 kms.); Quilimane—Majunga—Antananarivo (1,600 kms.).

The total distance of 12,460 kms. (roughly 7,700 miles) was covered in ten days, or about 775 miles per day, which probably meant between eight and nine hours' flying per day.

OVER THE ROOF OF THE WORLD.

According to Reuter, Baranoff, a Soviet airman, has flown across the Pamir. This is the first time that the range has been crossed by air.

A RIVAL OF THE PTERODACTYL.—The Soldenhoff-Langguth monoplane, a two-seat tail-less low-wing machine with a Bristol Cherub engine.

Seven reasons

Why you should buy your machine through N.F.S.—

1. Because N.F.S. have a thoroughly experienced technical staff who will advise you, without prejudice, as to the best machine for your particular purpose.

2. Because the N.F.S. "engine service" scheme will permit you to exchange your engine for a similar one, and save the delay of overhaul.

3. Because no other organisation is in a position to give you the same service as N.F.S. can do through their chain of provincial aerodromes and landing grounds. If you are flying abroad, N.F.S. spare no pains to fulfil your requirements quickly, efficiently, and at a minimum cost.

4. Because, through N.F.S. you can arrange your requirements as regards insurance, hire purchase, maintenance, and overhauls, with the minimum of expense, and in the quickest possible time.

5. Because N.F.S. will give you the best price for your second-hand aeroplane in part exchange for a new machine, or sell your used machine on a commission basis.

6. Because N.F.S. can supply you from stock with all spare parts for the most popular types of light aircraft.

7. Because N.F.S. are the largest aeroplane sales distributing organisation in the country, and can, therefore, give you the most comprehensive service.

USED AIRCRAFT.

Second-hand machines at prices ranging from £120 to £750 are now available. Demonstrations at Hanworth and elsewhere. Please write for list.

COMMERCIAL AERONAUTICS.

CLASSIFICATION OF AIRCRAFT.

Classification of aircraft on the lines of ship classification has now become a matter of practical interest to the Industry, and both the British Classification Societies have taken it up seriously. Nearly three years ago the British Corporation Register of Shipping and Aircraft formed an Aviation Committee which included men of established position in Aviation circles. They drew up guidance rules for surveys, organised a staff, and started business. Now the importance of aircraft classification is emphasised by the announcement that Lloyd's Register of British and Foreign Shipping have formed an Aviation Committee and are apparently following the same track.

Not long ago the Press announced that the Air Ministry had authorised not only the British Corporation, but also the British Aviation Insurance Group, to do surveys for renewal of Certificates of Airworthiness on certain types of aircraft, subject, of course, to certain safeguards in regard to the standard of surveys, etc.

The situation arising through such authority being handed over to commercial interests was the subject of comment at the time and doubts were expressed as to the wisdom of such a course. Apparently this view has been accepted, for now the announcement is made that the authority accorded to the B.A.I.G. has been transferred to Lloyd's Register, and thus the other ship classification Society and not the B.A.I.G. is entering the field of aircraft classification.

The position is perhaps a little confusing to aviation people, and so this may be a useful opportunity of explaining the objects and significance of this classification.

As yet there is no possibility of saying much about the aviation activities of Lloyd's Register, as there is nothing to go on except the newspaper announcement, but one can appreciate what classification means by studying the work which has already been done by the British Corporation Register.

In the first place, there is a Register Book which gives particulars of registered and civil aircraft in all countries and, in addition, there is a separate "British Empire" section which gives a comprehensive list of civil aircraft registered in the Empire.

The aviation work of the British Corporation is under the control of a representative Aviation Committee, which provides a satisfactory safeguard for the interests of all concerned, and Major R. H. Mayo acts as technical consultant to the Society.

In accordance with the regulations and the practice actually followed, a Club or private owner of a light aircraft who elects to class his machine is entitled to have it examined four times a year (*i.e.*, every three months). One of these examinations is the Annual Survey for the renewal of the Certificate of Airworthiness.

Since the recognition of the British Corporation Register by the Air Ministry, this has meant that the annual C. of A. Survey and three Quarterly examinations have been done for an inclusive fee of five guineas, which is the same fee as that charged by the Air Ministry for renewal of C. of A. alone. Obviously, the additional three surveys by accepted specialists are a guarantee of maintenance which was lacking formerly, and the proposition is thus worthy of consideration, especially by private owners.

For some time Lloyds Underwriters have engaged the specialists of the British Corporation to survey and report upon damage to insured aircraft, and, according to the announcement by Lloyd's Register, the fact appears that their staff will also be available for this purpose. This is another way in which the classification Societies can help aviation interests. And there is the further possibility that better maintenance will enable Underwriters to reduce insurance premiums as the business of Aircraft Underwriting develops.

There is another aspect of the British Corporation's activities which will appeal to aircraft owners who are likely to fly abroad. The British Corporation has trained representatives in many parts of the Empire, and has made arrangements in various foreign countries also which will enable owners of classified aircraft to obtain reliable technical assistance in case of need.

AN IDEA FOR OUR PETROL FIRMS.

Mr. R. N. Thompson, of the Newcastle Club, whose opinion, as a successful business man, is worth having, recently wrote suggesting that the petrol companies were not doing their fair share to develop aviation. He now writes as follows:—

"Since I mentioned the matter I have thought more about it. Now, looking at the subject from the petrol companies point of view, I would say to myself: Here is a vast potential market for my goods, petrol and oil. Already I have and well and completely organized service for distribution. All that is required is a little extension or development of the service already established.

"I would map the country out with the assistance of a useful fellow like Rose (stout fellow, Tom, he was in our squadron overseas), and, just where I or we thought it advisable, would select suitable fields—preferably adjoining main roads and always with an eye to future developments.

"I would lease each field with an option of renewal or purchase. Having made my landing-ground complete with sausage, I would mark the name in large white letters *due east and west* across the drome, and if I did not feel the position warranted a permanent staff of *at least one*, I would arrange immediate communication with the nearest local garage for the necessary supplies. I would, of course, make the necessary arrangements with the right type of local man to see that he did his best to afford the visiting pilot every attention.

"I would not expect an immediate huge increase in my sales. But I would have the common sense to know that I was increasing the efficiency of my present sales and service organization, and laying the foundation for the future development of aviation.

"Actually the above development could be carried out without increased cost to any petrol company. All they need to do is to transfer the amount expended on the hideous enamelled sign and hoardings which serve no useful end.

"This then is R. N. Thompson's scheme for the immediate service of a delightful sport and an important and vast field of commercial interests, to get on with it. Of course, it is quite obvious to your good self that the above scheme could very readily be adopted by the Automobile Association and R.A.C., who already have telephone-boxes and scout-service and patrols scattered around the country.

"I certainly think the petrol companies are short-sighted in their policy in sitting waiting for developments instead of seeing what they can do to increase their sales. Hang it all, no body of persons has more to gain from aviation than the petrol magnates.

"Personally, I have never had any trouble with farmers. Wherever I have landed I have always found them real sports. In fact, one even went to the trouble to cut down a hedge to get the machine into a better field for me. But always when making a landing in a strange place there is the doubt or anxiety as to the reception by the farmer. I certainly think the rapid and satisfactory development of flying is very largely bound up in the question of landing-grounds."

IMPERIAL AIRWAYS SERVICES.

In the House of Commons, on Oct. 30, in reply to a question by Lieut.-Cmdr. Kenworthy, the Under-Secretary of State for Air said that as regards the Air Service to the Cape, the proposals had now been agreed with the various Governments concerned, and a survey party, consisting of representatives of Imperial Airways, Ltd., and an Air Ministry official, had left this country for Cape Town for the purpose of visiting the countries on the route and settling details of ground organisation in consultation with local officials. [Mr. F. Tymms, who made a journey through this area a year or two ago, and Captain Gladstone, who made the pioneer flights over it, have just left on this mission.—ED.]

As regards the England-India air service, proposals for its early extension from Karachi to Calcutta were now under consideration by the Government of India, and estimates for the further extension of the service to Singapore and Australia were being examined. Mr. Montague added that the service half-way from Alexandria would be in operation by June of 1930, and the rest within six months of that date, or the very latest by April 1, 1931.

TWO VIEWS.

A French journal known as *Le Journal de L'Aviation Française* publishes the following:—

Les Anglais annoncent avec satisfaction que, en 1928, *leurs avions ont parcouru* 1,600,000 *kilomètres et transporté* 27,659 *passager sans accident.*

Pour 1929, *ils n'oublieront pas le "City of Ottawa" du service Londres-Paris.*

Such a spiteful remark as contained in the last paragraph seems quite uncalled for. Great Britain, unlike most other countries, has always announced particulars of all its accidents (including those in the Royal Air Force) and no secrecy is maintained as to the types of aircraft involved in these accidents. Apart from Air Ministry announcements to the Press, and the findings of Courts of Inquiry, which are available for all to see, the Department of Civil Aviation publishes an Annual Report, which gives full information concerning accidents in Civil Aviation.

Digitized by Google

It is only within the last few months that the newly constituted *Ministère de l'Air* has been prevailed upon to publish particulars of French aircraft accidents, and even now certain sections of the French Press studiously avoid mentioning even the types of aircraft involved in any accidents, apparently for fear of losing the advertising of their clients.

Perhaps the journal in question will gloat over the recent misfortunes of Imperial Airways in connection with its two accidents on the England-India route.

There is comfort in noting that journals of bigger circulation, and apparently of greater standing in France, do not hold a similar outlook.

With reference to the "City of Rome" disaster *Les Ailes* offers its sympathy to Great Britain in the following words:

C'est un grand malheur qui s'abat sur l'aviation britannique et nous concevons parfaitement l'émotion qui a agité le pays à l'annonce de cette nouvelle.

Nous dirons donc à nos amis anglais que tous les aviateurs sont solidaires devant le destin et que toute l'aviation française a été douloureusement frappée par ce coup du sort. Elle offre à sa camarade britannique le réconfort de sa sympathie attristée.

For these kindly and courteous words all British aviators will tender grateful thanks to *Les Ailes*.

"THE CITY OF ROME."

The following letter which appeared in *The Times* of Nov. 1 makes interesting reading in connection with the disaster at Genoa:—

Of all things that float—excepting the seaplane—a flying-boat is the most difficult to pick up and take in tow. Should the tow-line break she will drift to leeward, like a balloon, at a rate depending on the strength of wind and the state of the sea. This is because she is a non-displacement craft, and because she has such immense wind surfaces.

In bad weather the attempt either to come alongside a flying-boat or to pass her a tow-line is a task of appalling difficulty; at night-time these difficulties are, of course, much increased.

Regarding the competence and courage of seamen of other nationalities, I should like to add a personal word. It has been my misfortune when piloting flying-boats to have been twice forced down in the Mediterranean, once by engine failure and once by stress of weather. In one instance we owed our lives to Italian seamen who risked theirs to save us; and on the other occasion we were picked up in a heavy sea by the lifeboat's crew of a Portuguese tramp.—Mr. John Scott Hughes, 112, Church Street, Kensington, W.8.

THE LONDON TERMINAL AERODROME.

ANALYSIS OF FIGURES FOR PAST WEEK.

Trips per Day:—Sunday, 11; Monday, 20; Tuesday, 30; Wednesday, 30; Thursday, 24; Friday, 20; Saturday, 20.

Imperial Airways Ltd.:
London—Egypt—India: London—Le Touquet—Paris—Basle—Zurich: London—Ostend—Brussels—Cologne and return: Machines 51, passengers 407, freight 29¼ tons. India Route: Inward, passengers 0, mail 0 lbs.; outwards, passengers 0, mail 633 lbs.

Air Union:
Paris—London: Machines 44, passengers 198, freight 19¼ tons.

K.L.M.:
Amsterdam—Rotterdam—London: Machines 19, passengers 96, freight 5¾ tons.

Sabena:
Brussels—London: Machines 8, passengers 9, freight 2¼ tons.

Machines, 67; Passengers, 96; Crews, 99; Total personnel, 195.
Corresponding week, 1920:
Machines, 52; Passengers, 79; Crews, 63; Total personnel, 142.

CROYDON NOTES.

Passenger figures for October this year in and out of Croydon Aerodrome are distinctly better than the previous year. In October 1928 the figure was 3,046, as against 4,342 for October 1929.

The Deutsche Luft Hansa A.G. Winter programme began on Nov. 1, when several services were cancelled. Nevertheless, 14 services are still flown daily (except Sundays) from and to Berlin, and the day's mileage of the firm has been increased this Winter from 4,375 miles to 7,250.

The London—Berlin Winter service of Luft Hansa is comfortably flown in one day. The section Hannover—Berlin is specially illuminated for night flying and regularly flown in darkness throughout the Winter, as the Berlin plane leaves Croydon at 09.55 and reaches its destination at 18.15.

The latter half of the London to Berlin journey must be most attractive to passengers unaccustomed to night flying, who, from the comfortable, well-heated cabin of a Junkers or Rohrbach three-engined machine can look down upon the well-lit air route, and see the lights of Berlin from the air just before they arrive there. All Luft Hansa planes on this line carry pilot, flying mechanic and wireless operator.

A prominent New York citizen was being shown the Aerodrome recently. On the tarmac were a large number of little wooden boxes with red seals on them, all by themselves in the sunshine.

On being informed that the boxes contained the sort of stuff Britain pays its War Debts with, namely, Bar Gold, the American nearly swallowed his cigar with surprise and his eyes popped so much that they nearly fractured the lenses of his horn rimmers.

In America, he explained, and especially in Chicago, dollars lying around loose like that would be guarded by marines, machine-guns, armoured cars, cops, airplanes, tear-gas squads, ex-prize fighters and, in fact, all the panoply of peace, and he finished up by guessing we Britishers probably hadn't got a darn policeman within miles of the stuff.

"Oh, yes we have," said his British guide indignantly, "and there he is"—pointing to a 70-year-old police pensioner, remarkably agile for his age, considering he had bunions on one foot, and an impediment in the other, who was sheltering semi-comatosely in a doorway 200 yards away from the bullion and who doubtless supposed the boxes to contain Melton Mobray pork pies, if he had any ideas at all on the subject.

The K.L.M. London—Copenhagen—Malmö line, which was run in conjunction with A.B.A. Sweden last Summer, showed 100% regularity in both directions during August. K.L.M. was running eleven services during August, or 22 journeys per day, some of which were scheduled to arrive at their destinations at a very late hour, yet the regularity figure for that month on all lines was as high as 99.2%.

Swedish schnapps is a fiery fluid. After a no-heel-tap bumper of it an expert is still able to give a faint, melodious whistle, a custom which perhaps originated in a desire to warn the bloke responsible for the next round that it was time to get on with it. Anyhow, all good Swedes do whistle after a mug of the national beverage, and the point is that the unaccustomed foreigner is more likely to go blue in the face after a non-stop sup of Swedish schnapps and make a noise like a police rattle.

One of our Aerodrome heroes, a true Briton, of course, was challenged to go through this whistling business in a select Swedish restaurant in Paris not long ago. If the Swedes expected to see our hero flinch they were out of luck. Not only did the potent beverage slip down like water on an oily windscreen, but, when he whistled afterwards a gentleman at the next table, who received the full blast, had his soup blown clean out of his plate, and the chef in the back premises of the restaurant rejected an egg on the grounds it had whistled deafeningly and insultingly at him.

A well-known Trades Union leader who travels by air quite a lot is met at this end by a shiny saloon car with knobs on. The outfit is worthy in all respects of the first duke in the land but for the subtle fact that the chauffeur wears a soft-felt hat instead of a uniform cap, and so a decent democracy is maintained even when running over a member of the ignorant working classes. We could mention names, . . .—but we never says nowt about owt.—Spry.

THE INDIA AIR-MAIL TROUBLES.

Imperial Airways have suffered a series of misfortunes in the last few months and apparently their run of bad luck has not yet worked itself out. Besides losing the Calcutta off Spezia, Imperial Airways lost the use of another Calcutta off the African coast. This machine had its bottom stove in while taking-off. The remaining machine of the same type had its chine-struts damaged. Fortunately this is not serious, and by the time this appears in print the damage will have been rectified.

The Karachi correspondent of *The Daily Mail* states that after Nov. 12 the homeward-bound mail will leave Karachi on Tuesdays instead of Sundays.

There have been rumours of such a change for some time. It has the advantage of allowing the outward-bound mail to be answered by return instead of having to wait a week.

THE INDIAN AIR MAIL DELAY.

The Postmaster-General announces that owing to the damage to Imperial Airways marine aircraft on the Mediterranean section of the England-Indian Air Mail route the homeward Indian Air Mail which left Karachi on Saturday, Oct. 26, is being conveyed from Alexandria to Genoa by steamship and will not reach London before next Tuesday afternoon.

Until further notice, the air mail will be carried from Croydon on an air route *via* Cologne-Nuremberg-Vienna-Budapest-Belgrad-Uskub-Salonika, instead of *via* Genoa, to Athens, whence the normal route to Karachi will be followed.

The service from Karachi will follow the same route. The scheduled times of arrival at Athens and beyond by the outward service are substantially the same as at present. A further announcement will be made regarding the timing of the inward service.

THE WINTER AIR MAIL SEASON.

The Postmaster-General announces that a new edition of the Air Mail Leaflet, giving particulars of the winter services, is now available. It contains two maps, showing the principal Continental and oversea services used, and also an inset with a map and details of the direct service to India.

Apart from the usual temporary suspension of certain services during the winter, the most important alteration shown in the leaflet is the reduction, as from November 4, of the air fees for countries served by the England—India Air Mail Service. These air fees, which are additional to the ordinary postage charges, will be as follows:—

Egypt and Palestine:—Air fee, 2d. per half oz.; ordinary postage, 1½d. first oz., then 1d. per oz.

'Iraq:—Air fee, 3½d. per half oz.; ordinary postage, 2½d. first oz., then 1½d. per oz.

Persia (including Gulf Ports):—Air fee, 5d. per half oz.; ordinary postage, 2½d. first oz., then 1½d. per oz.

India:—Air fee, 5d. per half oz.; ordinary postage, 1½d. first oz., then 1d. per oz.

Correspondence for Persia can now secure accelerated delivery in Persia by air services from Baghdad to Teheran and from Bushire to Shiraz and Ispahan. The air fee of 5d. per half-ounce in addition to ordinary foreign postage covers transmission by the England—India air route to Baghdad or Bushire as the case may be, and thence by air into Persia. Correspondence sent by the England—India air route prepaid at the full Indian rate can now overtake the ordinary mail for Australia, New Zealand, and the Far East, despatched from London on the previous Thursday evening.

The leaflet also shows:—

Alteration (as from Nov. 4) of the air fee for the United States, Cuba, etc. (air transmission by the United States lines) to 4d. per half-ounce.

A new service to Central and South America (New York—Miami—Havana — Belize — Tela — Managua — Cristobel — Guayaquil — Trujillo — Callao — Mollendo).

Copies of the new leaflet may be obtained free of charge from any Post Office.

INDIVIDUALITY.

Temperament.

Mass production methods are totally unsuitable to flying instruction. The *personal touch* in flight tuition is essential to bring out the INDIVIDUALITY of the pilot. Differing temperaments call for variations of method, and the instructor must be sufficiently EXPERIENCED to recognise various temperaments and treat them accordingly.

Personality.

It is at BROOKLANDS that you will find the PERSONAL TOUCH that develops individuality. The vast experience of the Brooklands instructors enables them to bring out PERSONALITY in flying, Specialised teaching can only be given by specialised teachers.

REMEMBER that the members of the Board of the Brooklands School are ALL fully qualified pilots, and that the instruction staff have been engaged in all forms of PRACTICAL aviation *continuously* for over fourteen years.

ON SOME RECENT ACCIDENTS.

There has been such a crop of aeroplane accidents lately at, although we of THE AEROPLANE believe in treating r accidents more or less as a matter of course like street cidents and railway accidents, there seems to be good ason, or even a need, to discuss some of them in the light what is known about them, in the hope that by doing other accidents may be avoided in future. Also, some conderation may be given to the question of the qualifications nd training of pilots who are to be licensed to carry pasngers for hire or reward, either as air-line or taxi pilots as instructors at flying-schools.

Hitherto we have all believed that any pilot who has left he R.A.F. with a good record of freedom from accidents must be the best pilot to be had. But there is reason to believe that pilots trained in the R.A.F. may not be by any means the best pilots for the purposes of air transport, that, at any rate, pilots out of the R.A.F. would be the better for instruction in the handling and operation of civil aircraft.

Before starting to consider these accidents readers will do well to remember that actually the number of flying accidents to British aircraft with British pilots, and in British aviation as a whole, is very much lower in proportion to the total amount of flying done than it is in any other country. With the possible exception of the Netherlanders, our pilots are steadier and more careful than those of any other nation, our motors are rather more reliable and are kept in much better order, and our aircraft are better built and better maintained. And, even though their speed is poor and their design is archaic, some of our aeroplanes and seaplanes lift a better pay-load than do those of any other nation.

So far as accidents are concerned the British manufacturer has probably a finer record of freedom from failure in his structures than has any manufacturer in the world. Although there is plenty of reason for criticising the British manufacturer for his lack of business enterprise in refusing to produce what the market needs and for not going out to sell such stuff when it is produced, nobody can say that British workmanship is not the best in the world. The Prince of Wales was right when he suggested that our business men are not worthy of our workmen.

In discussing accidents we may leave out of the argument the two R.A.F. pilots who collided in the air near Croydon recently, and came down safely,—thanks to their standard service Irving parachutes. They were practising fighting, and that is always somewhat hazardous.

Apparently one pilot got into the slip-stream of the other and fell into a spin. As he recovered from the spin he somehow got the other machine into his blind spot while his own machine was in the blind spot of the other pilot. It was just one of those happenings which even the best of pilots cannot avoid, like that in which Squadron Leader Longton and Major Openshaw were killed at Bournemouth. Only this time both pilots were high enough to get clear of their machines.

Where they were lucky was that they both landed practically unhurt on soft ground, although the area into which they fell is quite thickly inhabited. One of the greatest dangers of descending in a parachute is that it may fall on the roof of a house and the parachutist may fall off the house and be killed by falling into the street, as happened to a woman parachutist in Coventry some thirty years ago.

THE JUNKERS ACCIDENT.

The Junkers accident near Godstone certainly deserves discussion. The remarkable escape of Lieut.-Commander Glen Kidston, R.N., and the death of Prince Eugen of Schaumberg-Lippe, who died, apparently from sheer shock, after escaping from the machine, only shows how narrow is the margin between a fatal accident and an accident which may afterwards be treated as quite a good joke.

Apparently Commander Kidston, seeing that a crash was coming in any case, hung onto the luggage-rack, took the shock on his arm in tension, and got out after the crash and before the fire came. The other passengers seem

**"NOW THE GREAT WINDS SHOREWARD BLOW,
NOW THE SALT TIDES SEAWARD FLOW."**—*(Matthew Arnold.)*

A REAL PLEASURE CRAFT.—The Saro "Cutty Sark" (two Cirrus Hermes engines).

Digitized by Google

to have been shot up into the front of the machine by the impact with the ground, stunned by shock-loading in compression, and then burnt—very much in the same way as the passengers in the Handley Page which came down in the Channel were flung into the front of the machine and stunned and drowned while those who were at the back of the cabin were able to get out.

Obviously the cause of the Junkers accident was simply that the pilot was flying too low. This seems to be a common fault among *Luft Hansa* pilots, unless other similar incidents of which one has heard were all due to the same pilot who was killed at Godstone.

Some few weeks ago an Englishman who has a great deal to do with aviation was coming from Berlin to Cologne in a Junkers when the machine ran into low clouds, or high fog. The pilot kept low, and every now and then when the fog was a bit thinner this passenger could see that they were flying quite close over the tree-tops of a forest. Suddenly the machine gave a heave to one side, and, as the wing on his side went up, he looked out of the window and saw the top of a pine-tree just brush through what one might call the arm-pit of the machine,—that is to say the angle between the wing and the fuselage. They scraped along like this for miles and miles, and eventually got to Cologne, as he said, more by God's Grace than by good judgment.

Another English passenger going to Berlin said that the machine ran into heavy rain and darkness an hour before they got there. They finished the journey just over the roofs of the houses in Berlin and actually *below* the neon lights on the various towers which are lit-up at night for the guidance of aircraft.

Other English passengers have also told strange stories of barely escaping mountain sides and tree-tops while flying in *Luft Hansa* machines.

On the other hand an experienced English pilot, who is now a high official of one of our greater aircraft concerns, came back from Berlin not long ago in a three-engined Junkers which travelled nearly all the way over the clouds, took its direction by wireless at about 5,000 ft., and finally came down through the clouds into clear air at 1,000 ft. just over Ostende. Consequently the probability seems to be that certain *Luft Hansa* pilots have had this bad habit of tree-scraping in fog, presumably without the management of the firm being aware of it. And possibly this last unfortunate accident will scare other pilots off making a similar mistake.

Presumably all the *Luft Hansa* aircraft now carry proper wireless equipment, and so can navigate properly over clouds or through them without taking such appalling risks. Personally, on a fine day and flying against the wind, one prefers hedge-hopping to any other method of progress. There is quite a lot of interest to be got out of watching the cars on the road and the cows in the fields and the old ladies hanging the washing out to dry. But, if one *must* fly in fog, then any pilot who flies lower than the top of the highest hill within fifty miles is just a plain natural-born fool.

The Spezia Loss.

We may now turn to considering the wreck of the *City of Rome,* off Spezia in the Gulf of Genoa. What was the real cause of the accident will never be settled. We know from the wireless message that one engine failed, but even so the Calcuttas fly quite well on two engines. So the machine could at any rate have reached the shore some fifteen or twenty miles away or could even have finished the journey quite well on two engines, in spite of the gale.

One theory is that in the middle of the gale a line-squall struck the machine and forced her down. Another is that driving the two engines full out, to do the duty of three, over-stressed one of them and so forced the machine down.

The real point is whether, when once it was down in such a gale, any flying-boat could have lived. When one first referred to this accident one said that the blame rested on those who sent people to sea in un-seaworthy boats. Lest there should be any misunderstanding, one would like to make clear that this phrase did not refer either to the constructors of flying-boats, or to the management of air lines or other commercial services which have to use flying-boats. As was said at the time, the development of flying-boats has been disgracefully neglected by all nations, and though we in England happen to have the finest flying-boats in the World, we are still a long way from having ocean-going flying-boats at all as they should be. The people who force others to put to sea in unseaworthy boats are the Governments of all nations who have not given enough encouragement to the designers and builders of flying-boats.

Possibilities of Flying-Boats.

The possibilities of flying-boats are enormous. There is in fact no reason why we should not have a flying-boat service between Europe and the United States within the next few years, other than the fact that the development of flying-boats has been so much hampered by lack of money.

The first serious attempt to build a flying-boat on the heroic scale is the Dornier Do.X. But even that, gigantic as it seems at present, would not stand up to a first-class gale with its wings on it. It would certainly ride out a bigger sea than any existing flying-boat, but even so it is not a sea-worthy boat.

ONE OF THE BEST.—An all-metal Widgeon with the Hermes engine and its new cooling-cowling which is sold by the Cirrus Co. with the engine.

UNIQUE

British Triumph!

for Air, Land and Sea!

Air — 1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163 4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192.4 m.p.h.

1926 The first non-stop crossing of South Atlantic Ocean carried out by Commandante Franco flying a Dornier flying-boat with two Napier engines.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281.669 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

Land—1929 The highest speed ever attained on land was made by Major Sir Henry Segrave when he drove his Irving-Napier car over one mile at the amazing speed of 231.36 m.p.h.
Capt. Malcolm Campbell set up world's land speed records at Verneuk Pan with his Napier Arrol-Aster as follows :—over 5 miles, speed 211 m.p.h.; over 5 kilometres, speed 216.53 m.p.h. They both used Napier engines.

Water—1929 The world's motor-boat speed championship was won at Miami by Major Sir Henry Segrave, driving Sir Charles Wakefield's Napier-engined "Miss England."
Sir Henry Segrave at the Lido with the same boat made six runs over the measured mile, averaging a speed of 92.8 m.p.h.
At this meeting, competing against the best from Italy and America, Sir Henry Segrave won all trophies, including the Duke of Piedmont's cup and Count Volpi's cup.

NAPIER

The finest aero engine in the World

D. NAPIER & SON LTD.
ACTON · LONDON, W.3

Although the idea has been described as fantastic, there is no engineering reason why we should not have what has been so long advocated in this paper, namely, a perfectly good motor life-boat attached to a separate unit consisting of wings, tail and aero-engine plant, to which it can be attached or from which it can be detached in a moment. There are dozens of ways in which the job could be done by any first-class mechanical engineer with very little addition to the weight or cost.

Remembering that one hammered away at the Air Ministry for something like five years before they adopted parachutes, which have already saved thirty lives in the R.A.F., one expects to have to hammer away for another five years at the Air Ministry before they produce flying life-boats.

Actually our best hope of progress is that some of our great shipping companies will begin to take a live interest in aviation and, with their knowledge of sea work, will insist on having flying life-boats and not the things which we call flying boats. They will have to pay a bit more for the first one or two, but then shipping companies are used to thinking in millions, and a mere £40,000 or £50,000 or £60,000 for an experimental flying-boat is not going to frighten them.

There are in fact more opportunities for flying-boat lines linking up parts of the British Empire with the rest of the World than there are for land lines. People insist on thinking of a line from England to the United States as our first necessity, just as people have always insisted on thinking of a line from London to Paris as being the obviously necessary air line. But, just as there are a hundred miles of air line in Australia for every ten miles of British air line in Europe, so there are a hundred or perhaps a thousand miles of sea-going air line in the British Empire for every ten miles on the trans-Atlantic passage.

Actually we could probably run a high-speed mail line to the Cape by flying-boat quicker than we could run it by the land route through Egypt and Central Africa. And we have enough possessions on the West Coast of Africa to make a mail line of this kind worth while, even though there might not be enough passengers to make it pay as a passenger line. Such a line could quite well be all-British, except that perhaps we might make Lisbon, the capital of our oldest European ally, Portugal, our first stopping place.

From that route we might run an off-shoot to South America. Already the French have an excellent mail service to South America, but it crosses the South Atlantic by boat. And as the World's greatest seafaring nation, here is our great opportunity to maintain our reputation by putting a flying-boat line across.

Undoubtedly the stretch from Singapore to Australia should be done by flying-boats. And so should the stretch from Calcutta to Singapore. And then there are opportunities for another great flying-boat line from Singapore up to Hong Kong.

There is enough mail carried on all those routes, and enough business done on them, to make them all pay simply as mail lines. So all we have to do is to build the right sort of boat for the job. But if we try to run them with boats of any existing type we shall merely get a bad name for air-transport.

Seamanship.

In a recent article on airports, air-parks and aerodromes, one pointed out that a pilot of seaplanes or flying-boats has to be a great deal cleverer than a pilot of land machines, for he has to contend with tides and currents running contrariwise to the wind. But, apart from mere cleverness, a seaplane pilot ought to have quite a good training as a seaman.

Although no official statement has been issued as yet, there seems no reason to doubt the story of the skipper of the *S.S. Famiglia* which tried to salve the *City of Rome*. His report stated that having got to windward of the *City of Rome* he floated down a lifebuoy with a grass-line attached, which line was made fast to a heavier cable—which a sea-going correspondent calls a towing-pendant.

The pilot, or somebody else in the *City of Rome*, picked up the grass-line, which he secured to the boat and then waved to the skipper of the *Famiglia* to tow. The skipper is reported to have said that owing to not knowing English he could not make the pilot of the flying-boat understand that he should haul in the grass-line and make fast the heavy towing-pendant, so he had no option but to try to tow on the grass-line, with the obvious result that it soon parted.

Now the point is that any seaman would have known that the grass-line was merely used to float down the heavier line. Naturally the towing pendant could not be made fast direct to the lifebuoy as the weight of it would have sunk the buoy. A grass-line floats and that is why it is used in this way.

One report says that the skipper of the *Famiglia* saw two or three people standing on the wing of the flying-boat. If this statement is right, then there seems a probability that one of the wing-floats had carried away, as has often happened to flying-boats under similar circumstances, and people were out on the wing trying to keep the wing-float on that side in the water.

When the grass-line parted very likely the boat swung round, dipped a wing into the water, and turned clean over. That would account for the fact that the *Famiglia* was unable to find any trace of the boat when she turned to search for it after the parting of the line.

The S.O.S. Question.

Another point which seems worth mentioning in this connection is the failure of the S.O.S. As was reported at the time, the S.O.S. from the *City of Rome* was jambed at Spezia by a ship in the harbour which was doing some wireless practice on its own account. But the signal was picked up by Antibes and broadcast to the Mediterranean.

The *Famiglia* had no wireless, and found the flying-boat by sheer chance just when darkness had set in. The Calcutta had then been afloat in that gale for several hours, which shows at any rate that as flying-boats go in these days the Short Calcutta is as seaworthy a boat as exists.

Whether the signal from Antibes ever got to Spezia or not has not been stated officially. If it was picked up at Genoa or Naples, probably they would assume that Spezia had had it also and would not take the trouble to telephone to Spezia about it. So far as can be gathered the first information Spezia had was the arrival of the *Famiglia* to report that she had lost the *City of Rome* in the dark. What time she arrived is not known, but apparently the first ship to leave Spezia Harbour, at about 11 p.m., was an Italian destroyer, and she put back because of the bad weather.

There is of course the chance that if the S.O.S. had been received at Spezia when the *City of Rome* came down, something out of Spezia Harbour might have found her before dark. But remembering that during the War 1914-18, two destroyers of our Royal Navy in Kingstown Harbour took about an hour to get out of harbour and reach the Royal Mail Steamer *Leinster*, which had been torpedoed less than twenty miles away and well within sight of the harbour, with the result that a large number of lives were lost, perhaps we should have been asking too much of the Italian Navy to have expected them to have rescued the *City of Rome*.

SOMETHING LIKE AN AIR LINER.—The new big Junkers, with passenger accommodation in its wing, which is 8 feet deep. The "landing stick," under the nose of the fuselage, and the balance of the ailerons is noteworthy.

Anyhow, the point is that the S.O.S. did not work, and the S.O.S. has not worked, so far, in the English Channel although several aircraft have been into it. In each case the passengers and/or crews have been rescued by boats that happened to be near. The probability is that when the next Imperial Airways Argosy or 40-seater falls into the Channel we shall again hear stories of the failure of the S.O.S.

Some few years ago, one believes, Imperial Airways made an experiment with a flying-boat. The pilot's instructions were to fly over the Channel, send out an S.O.S., come down on the sea and await developments. He waited four or five hours. Nothing happened, although tugs and so forth are supposed to be instantly ready to dash out when the S.O.S. comes in.

There is only one way of keeping this service efficient and that is for a regular S.O.S. routine to be maintained at Channel ports. Once a month this routine should be exercised. An R.A.F. seaplane or flying-boat could easily send out an S.O.S., and alight on the sea, just as Imperial Airways' pilots would alight, or perhaps rather better than some pilots have done.

To avoid unnecessary disturbance of merchant shipping, the standard S.O.S. could be modified so that the aircraft relief service only would come into operation.

After several months' practice of this sort we ought to be able to depend on a certain amount of efficiency. At present the whole thing seems to be run on the hit-or-miss principle.

Obviously aircraft will go on falling into the Channel as long as they fly over it. But we do not want to wait till one of the new 40-seat Handley Pages falls in. That would mean an unpleasantly large death-roll.

How Things Happen.

Some readers may think that other recent accidents have been caused by inherent defects in either our seaplanes or our land planes, apart from the fact that all aircraft in the World are considerably worse than they should be simply because of the natural slowness of human nature to make progress as it should. Therefore something must be said about the reason for the official statement that the England-to-India mail will in future go from Salonika to Alexandria instead of from Genoa as it has hitherto.

Only three Calcuttas were bought by Imperial Airways, Ltd., with which to start this service. One of them, the *City of Rome*, was sunk, as everyone knows. Another one was run on a rock, because the pilot tried to take off with too short a run out of the lagoon at Mersa Matruh. The third was put out of action because the boat fouled a buoy and knocked out one of the struts under the wing between the wing and the chine of the hull.

Another accident to which reference may be made with advantage is that which happened at Jask some months ago. That also seems to have been due entirely to misjudgment by the pilot.

The aerodrome there is about three miles long and a mile wide, and the surface, as Sq. Ldr. Bert Hinkler said some time ago, is of baked mud which looks like smooth cement. Naturally, especially at night, the height of a machine from this mud flat is about as difficult to judge as is the height of a machine from dead smooth water.

Apparently the pilot of the Hercules was coming to land, and, instead of landing perfectly straight and taking his level from the paraffin flares which had been lit for him, he tried to turn, probably with the idea of coming to rest near the supply-base, or whatever it is, instead of landing straight ahead and running some distance from it.

Whatever the cause of his turning may have been, while turning he touched the ground with the particular wing-tip on which his flare was burning. The wing crashed under the weight of the machine and caught fire, and the survivors got out before the fire reached them, just as Lieut.-Commdr. Kidston got out of the Junkers the other day.

Skill and Caution.

During the last few weeks one has discussed accidents of all kinds with a number of American friends. In the States, just as here, far more accidents happen through errors of judgment, or often through sheer carelessness by pilots, than happen either through defects in the aircraft or engine failure or weather.

In all businesses or sports calling for personal skill, the possession of considerable skill is apt to bring that familiarity which breeds contempt. People who do a thing well are too apt to trust their own cleverness to get them out of a tight corner. All the same, the really clever pilot is not the pilot who is so clever in getting out of a tight corner, he is the man who is too clever ever to get into a tight corner.

At present whenever a firm or an individual wants to employ a pilot, practically the only possible source of supply is the number of pilots who leave the R.A.F. each year on the expiry of their Short Service commissions. Very few men can afford to learn to fly as civilians and afterwards put in enough flying to qualify for their "B" licences.

The worst of the R.A.F. system of training is that it is apt to give young men entirely wrong ideas on the subject of flying. In the first place they do not have to pay for breakages themselves, and unless they are extraordinarily unlucky or clumsy they do not get hauled over the coals badly for breaking Government property. Also Service flying, even in time of peace, naturally involves dangerous flying to a certain extent.

The Service pilot who always took Safety First as his watchword, as every good civil pilot should, would very soon get himself the name in the R.A.F. of having cold feet. And in fact a pilot who always flew for safety on Service machines would find himself in time of war in very bad practice for air fighting.

Also, R.A.F. pilots are accustomed to flying machines with heaps of spare power, and many of them with wonderful oleo undercarriages, with the result that they get into the habit of pulling machines off the ground without really having to fly them off. Likewise they get into the habit of slamming machines onto the ground anyhow without the need for making the kind of landing which any passenger-carrying aeroplane ought to make.

In fact, to put it quite bluntly, unless he happens to be a man with real intelligence and with great self-restraint, who is deliberately training himself to be a civil pilot, the ordinary R.A.F. pilot is apt to become slap-dash and ham-handed and a trifle careless. He is apt to think on the lines of one of our earliest Naval ratings to take a hand in aviation, who used to say, whenever a machine was crashed or any unusual extravagance happened: "Ah, well, the Navy's a big firm, Sir, and it won't notice it."

The result is that when he gets into a civil machine of

HER HOME TOWN.—The Junkers J.38 over Dessau,—she has a span of 107 feet, has 2,400 h.p., weighs 20 tons, and has a speed of 124 m.p.hr.

Extract from "The Times Engineering Supplement." 9/11/29

"The latest type of Cirrus engine, Mark III, has been standardised by National Flying Services for all their aircraft. This decision is the more interesting as the company are using several kinds of light aeroplane for their club, instructional and training work. There are obvious advantages from the operator's point of view in standardisation, and no doubt the long record of reliability which the various Cirrus engines have set up played its part in the decision"

any sort, even though he may have a particularly good record in the R.A.F. for freedom from accidents, he is quite apt to handle his machines in a way which an old experienced civil pilot would regard with horror.

RULES AND SENSE.

In this connection one of the greatest jokes one has come across concerns a young civil pilot who learned to fly almost immediately after the War when he was barely old enough to have a pilot's certificate. He happened to have only one effective eye—the other had been damaged when he was a child. Consequently he is only accustomed to seeing everything with one eye. But because he only has one effective eye the Air Ministry refuses him a licence.

In those early days after the War he flew the most extraordinary aeroplanes, some of them antique Avros which were falling to pieces and others machines of types which in these days nobody would ever think of flying and many people *could* not fly.

So far he has never had an accident of his own making. Once in swerving to avoid somebody on the aerodrome who had run out after he had landed he pulled a machine to one side and damaged a wing-tip or something. Another time he ran into a hedge in a forced landing or something of that sort. In spite of his excellent record, he cannot get a "B" licence, though there is a regulation which says that defective eyesight shall not be a bar to anybody who flew prior to a certain date and whose eyes have not dis-improved since that date.

Not very long ago this particular pilot was working with a certain firm which was doing joy-riding. As he holds an "A" licence he could take the machines out and test them, but as he had not a "B" licence he is not allowed to take up passengers for hire or reward. Consequently his firm had to engage some pilots who had quite recently left the R.A.F.

When they came to fly joy-ride Avros their ideas were a trifle too modern. They were quite good pilots on anything with plenty of power, but the rotary-engined Avro sank them on the spot. The result was that they had to have a little dual instruction from our unlicensed one-eyed friend before they, the fully qualified "B" licence pilots, were quite comfortable in their new jobs.

FIND THE MEN.

There seems to be more than a doubt whether after all the Short Service pilot is really the best type for Civil Aviation. Apart from his flying methods he is not always quite serious about his job when he gets it. There is, in fact, a definite need in this country for a training school for civil air-traffic pilots, like the *Deutsche Verkehrsfliegerschule* in Germany—which turns out men who are more serious about their work than are the majority of R.A.F. pilots who are looking for jobs. A properly run school, with ruthlessly strict instructors, and with a management which would stand no nonsense, would soon get for itself such a name that graduates from it would be sure of getting jobs as air-transport pilots and as flying-instructors. And the time seems ripe for starting such a school now.

The one thing which is more difficult than finding a good job for a good man when he is out of work is finding a man to fit a job when a job is vacant. One may find a man who is capable of doing the job, but what is far more difficult is finding a man who is willing to work at the job for the sake of doing the job, and who is willing to take orders and advice from those who know more about it than he does. A combination of genuine ability and keenness and willingness to work for the sake of the work, is about the most uncommon attribute of mankind. And it is the only way to success.

If air transport is to become a sound business proposition in the future pilots of aircraft cannot be allowed to treat it as a joke. There is no use in having reliable engines and reliable aeroplanes if they can be piled up by pilots who treat their job with undue levity, or on the other hand by pilots who are too self-confident to be careful.

One of the best pilots in this country remarked the other day, when one asked him why he had landed in a certain way on a certain spot, that he had been flying long enough to treat every aeroplane with respect. He was quite right. Until pilots learn that even the best of aeroplanes are liable to turn round and bite if they are not treated with respect we shall not attain to that standard of safety which must be reached if aviation is to be recognised as a regular and profitable method of transport.—C. G. G.

ON SOME SERVICE PIONEERS.

The extract from *The London Gazette* which is published this week makes known the retirement of four distinguished senior officers of the Royal Air Force. Though the fact that they were going has been known for some time, their loss will be none the less deeply regretted, for all of them have in their different ways won the high regard of those who served with them,—and all of them are among the pioneers of Service Aviation. Consequently some short reminiscences of their Service career seems justified, and under the circumstances perhaps one may be forgiven for recalling some facts about them which would not be published if they were merely moving from one exalted position in the Service to another.

AIR COMMODORE T. C. R. HIGGINS.

Air Commodore Thomas Charles Reginald Higgins, C.B., C.M.G., was born in 1880 near Bedford, and was educated at Burney's, Gosport, and in *H.M.S. Britannia*. So, like several distinguished soldiers, he began his Service career in the Navy. He transferred to the Army in 1900 and was gazetted to The King's Own Regiment, with which he served in the South African War. Thereafter he served with the West African Frontier Force in Nigeria until 1911.

In that year he learned to fly on a Farman biplane at Hendon. His Royal Aero Club Certificate, No. 88, is dated May 16, 1911. And so, though he learned to fly for sport at his own expense, and though he did not join the Royal Flying Corps till the War 1914-18 had been in full blast for more than a year, he deserves to be ranked with the earliest of Service Pioneers, for actually he became a pilot before any but four of the Navy's aviators.

He was gazetted to the Royal Flying Corps as a Flying Officer on Sept. 14, 1915, when he had already been gazetted Major in his regiment on the first of that month. He was made a Flight Commander on Oct. 19, 1915, and a Squadron Commander on Jan. 3, 1916.

On June 25 of that year he was promoted to command a Wing with the rank of Lieutenant-Colonel and as such he did valuable work in France, with the result that on Jan. 4, 1918, he was promoted to command a brigade of the R.F.C. with the temporary rank of Brigadier-General. As such he commanded the R.A.F. Brigade which did such valuable service round London under Major-General Ashmore,—G.O.C., the London Air Defence Area.

Up till the end of 1917 he was still a Major in the Army, but on Jan. 1, 1918, he was promoted Lieutenant-Colonel by Brevet.

After the Armistice he commanded No. 7 Group, Andover, from July, 1919. In September, 1922, as an Air Commodore, he was appointed Director of Training at the Air Ministry. In April, 1926, he was appointed Chief Staff Officer in the 'Iraq Command under Sir John Salmond, and in April, 1928, he was appointed to command No. 10 Group, Lee-on-Solent.

Although he was 35 years of age when he joined the R.F.C., and had done little flying after qualifying for his Certificate in 1911, Major Higgins, as he then was, proved himself to be an unusually good pilot. Naturally, after taking over a Squadron in 1916, he had little opportunity of flying on active service. But one has a very distinct recollection of his arriving late one night at Sir John Salmond's headquarters beside Velu Wood about ten days before the Armistice, having flown over from England in a Sopwith Pup. The German air raids on London were then over, the Allies were advancing rapidly across France, and there was, one gathered, some question of his Brigade coming to France to help in making that advance quicker,—so apparently he had flown over to see the G.O.C. about it and thus save official correspondence.

He had landed practically in the dark on some sort of a temporary landing ground in the middle of the devastated area a few miles from Advanced G.H.Q. That may give some idea of his quality as a pilot. And incidentally that was certainly the last Sopwith Pup ever flown in France.

As a senior officer Air Commodore Higgins has always been noted for the excellence of his staff work and he has been highly esteemed for his intellectual ability.

AIR VICE-MARSHAL C. A. H. LONGCROFT.

Air Vice-Marshal Charles Alexander Holcombe Longcroft, C.B., C.M.G., D.S.O., A.F.C., was born in 1883 at Llandisilio, Aberayron, Cardigan, and was educated at Charterhouse and the Royal Military College. He was gazetted to The Welch Regiment in 1903.

He learned to fly on a Bristol biplane at Brooklands, and his Royal Aero Club Certificate, No. 192, is dated Mar. 5, 1912.

One has a vivid recollection of him as a pupil. As he soon became one of the finest pilots in the R.F.C., and to this day is as good a pilot as anybody in the Air Force, one can say that he is the outstanding example of the apparently hopelessly bad pupil who suddenly becomes a brilliant pilot. Admittedly the box-kite was not an ideal aircraft. It was easy to stall, and it was liable to fall over in every direction for it was utterly without stability. And so it was difficult.

One has a very clear remembrance of young Mr. Longcroft in his period of pupilage standing a box-kite on its front elevator and hitting the ground with his face before any of the rest of the aircraft hit the ground. Yet, very soon afterwards, when the R.F.C. was formed, and the original No. 2 Squadron was sent to Montrose under Major Bourke, Captain Longcroft was one of the most brilliant of a particularly brilliant group of pilots.

"Bristol"

BULLDOG

SINGLE SEATER FIGHTER.

This machine is exceptionally easy and untiring to fly; the controls are all balanced and operative down to the stall. At this speed the response is excellent and no tendency to spin is developed when the ailerons and rudder are used. In addition to being very powerful, the controls are well co-ordinated so that the effort required to operate them is similar at all speeds. Even at the highest speeds the balanced surfaces, which have been most carefully sheltered to prevent "snatch," ensure lightness of operation, a point which makes the machine extremely pleasant to handle. The stability in all senses is positive, and the metal structure with its high factor ensures absolute rigidity under all manœuvres.

Actually he joined the Air Battalion, Royal Engineers, on its formation in April, 1912, at Farnborough, and took part in the Army manœuvres of September, 1912,—the first in which aircraft were used seriously.

Three of his flights soon after that period are notable. First there is his great flight, which at the time was the World's Distance Record, from Montrose by way of Farnborough to Portsmouth and back at Farnborough non-stop, 445 miles, in a B.E.2. For this flight he was awarded the Britannia Trophy for the most meritorious performance by a British aviator in that year,—1913.

Another was his landing of a B.E.2 at Montrose in a line-squall which swept the whole of England from end to end and did an immense amount of damage. Capt. Longcroft was up over the sea when the squall came in from the West. By diving with his engine full on he just managed to get into the aerodrome, and his machine remained stationary over one spot on the aerodrome flying full out at a height of a few feet until a number of mechanics ran out, got hold of the wing-tips and hauled it onto the ground. As the speed of those machines was somewhere between 70 and 80 m.p.h. the strength of the wind may be judged.

Somewhere about the same time No. 2 Squadron went to Ireland on manœuvres. Getting out of one of those tiny stone-walled fields in the County Limerick Capt. Longcroft's machine was a bit sluggish, with the result that it hit the top of a wall which removed the tip of each of the four blades of its airscrew and the whole of its undercarriage. Instead of falling over the wall into the next field as most pilots would have done, Capt. Longcroft flew a complete circuit and put the machine down neatly on its belly, precisely on the spot from which he had started.

On the outbreak of War he flew to France with No. 2 Squadron and did a number of the first reconnaissance flights in the War. During the retreat from Mons he set out on reconnaissance and on returning to the aerodrome from which he had started made one of his usual excellent landings. Unfortunately the British Army was by that time some distance South, and German troops were already on the aerodrome. In those days no soldier knew one aeroplane from another, and a number of German soldiers ran out to the machine. Seeing that they were Germans Capt. Longcroft, who luckily had not stopped his engine, calmly took off again. The story at the time said that he waved his hand in a friendly way to the Germans, and so they did not fire at him. And thus he got away to become one of the greatest of the leaders of the R.F.C., instead of being either a prisoner-of-war or a casualty.

During the War he won the respect and affection of everybody who served with him. Not only was he one of the most inspiring, and at the same time considerate, of Commanding Officers, but the junior officers thought particularly highly of him because he was such an unusually fine pilot.

So far as one can recollect, those who served under him in France had only one grievance against him, and that was because of one very bad habit which he formed when he commanded a Brigade. He used to treat himself to a few hours' leave from Brigade Headquarters and go down to one of his squadrons and borrow one of their best single-seaters in which he used to go out over the lines looking for enemy aircraft. Thus he deprived the squadron temporarily of an aeroplane and entailed the risk of their losing their beloved Brigade-Commander.

His decorations give some idea of the work which he did during the War.—His first decoration, acquired in August 1915, was the Russian Order of St. Stanislas, with Swords. The R.F.C. at the time used to say that this Order carried with it in Russia the *ex officio* duty of Inspector of Seminaries for Young Ladies. But that one believes was purely a legend.

In July 1917 he was awarded the Cross of the Legion of Honour of France.

On Jan. 1, 1918, he was gazetted to the Distinguished Service Order for service in the Field. And on Jan. 1, 1919, he was awarded the Air Force Cross.

As most readers know, the Distinguished Flying Cross and the Air Force Cross were invented on the formation of the Royal Air Force in April 1918. The D.F.C. is to the Air Force what the D.S.C. is to the Navy and what the M.C. is to the Army. The A.F.C. is for those who fly with distinction not actually against the enemy. As someone has neatly put it, the D.F.C. is awarded for flying in the face of the enemy and the A.F.C. is awarded for flying in the face of Providence.

General Longcroft, as he then was, insisted on flying on every possible occasion and made many flights entailing considerable personal danger. In his rank he was not supposed to fly officially against the enemy and so he was given the A.F.C. for flying as he did.

At the end of January 1919 he was made a C.M.G. in recognition of his services during the War. And in January 1923 he was made a C.B. He was promoted Brevet Major early in the War and Brevet Colonel on Jan. 1, 1917. And he was mentioned in Despatches five times.

On Aug. 5, 1919, he was promoted Air Commodore and on Nov. 1 of that year he was appointed to a post which will for ever make his name memorable in the history of the Royal Air Force even after his gallantry in the War and the stories of his exploits have become mere legends. On him was then imposed the task of organising the R.A.F. Cadet College at Cranwell.

As the founder of that institution and its first Commandant he assumed a responsibility the results of which must always persist. The tone which is set and the spirit which is inspired in the beginning of an institution of such a kind must necessarily extend throughout the Service which it supplies with junior officers, and from the very beginning, thanks to Charles Longcroft and the Staff which he collected round him, Cranwell has lived up to the highest traditions of the King's Fighting Services.

After establishing Cranwell and commanding the College for four years Air Commodore Longcroft was appointed Director of Personal Services at the Air Ministry in December 1923. On July 1, 1925, he was promoted Air Vice-Marshal. And in November 1926 he was appointed to command the Inland Area.

His ability as a pilot, even in that rank may be gauged by his flying of a D.H.53 (a small low-wing monoplane with a two-cylinder engine) in the Air Ministry Inter-Departmental race at the Air Force Display in that year. And since then he has habitually flown single-seaters of all types.

Still more may his judgment be measured by the fact that some two years ago, when the Directorate of Technical Development was puzzled by the contradictory reports from expert test-pilots on the Handley Page slots, Air Vice-Marshal Longcroft was haled forth from his office by the

MODERN TRAINING.—The Hawker Tom-Tit, a two-seat light training biplane with the Armstrong Siddeley Mongoose engine, with fog-flying training-equipment and Handley Page automatic slots.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

Air Ministry and made to fly a Bristol Fighter so fitted, despite his protests that at his advanced age he should not be given a test-pilot's job to do.

No officer in the Air Force could cause greater regret by his retirement than does Air Vice-Marshal Longcroft. His outstanding characteristic has always been his loyalty to those under whom he served and those who served under him. And at all times he has been blessed by a sense of humour. Somehow these two qualities of his have always seemed to be excellently illustrated by a hitherto unpublished incident which one would never dare to publish but for the fact that he is now leaving the Service. On a certain night a week or so before the Armistice, in a Nissen hut which was his Brigade Headquarters, one saw him put a perfectly good Lieutenant-Colonel in the fire for speaking disrespectfully of Charterhouse.

Many generations of R.A.F. officers to come will find that the name of Air Vice-Marshal Longcroft will be held up to them as the highest standard which they can hope to reach. And those who attain to the standard which he represents will be a credit to the Service.

He is still a young man, as officers of his rank go, and there should be a great career before him when someone in a high position gives him an opening in which his strength of character can find a full outlet.

Air Commodore C. R. Samson.

Air Commodore Charles Rumney Samson, C.M.G., D.S.O., A.F.C., was born at Cheetham, Lancashire, in 1883. He was educated at Hemel Hempstead, and at the R.N.C. in H.M.S. *Britannia*. He joined the Royal Navy in 1898 and was promoted Lieutenant in 1904. Before taking to flying he served in Somaliland and in the Persian Gulf.

Apart from his notable war service the name of Air Commodore Samson has a prominent place in the history of British aeronautics. He was the senior officer of the first four officers allowed by the Admiralty to learn to fly. The others were:—Lieut. Reginald Gregory, R.N., who recently died in China, Lieut. A. M. Longmore, R.N. (now Air Commodore, C.B., D.S.O.), and Lieut. E. L. Gerrard, Royal Marine Light Infantry (now also an Air Commodore and a C.M.G. and D.S.O.).

All three were benevolently allowed to draw pay and allowances while living at Eastchurch and being taught to fly by Mr. G. B. Cockburn, a member of the Royal Aero Club, on Short biplanes lent free of charge to the Admiralty for the purpose by Mr. Frank McClean of the Royal Aero Club, at the Eastchurch Aerodrome which had been lent to the Royal Aero Club by Mr. Frank McClean (now Sir Francis).

Lieut. Samson soon became a particularly brilliant pilot. His Royal Aero Club Certificate, No. 71, is dated April 25, 1911.

Besides being a brilliant pilot he showed energy and initiative of a high order. In October 1911 he persuaded the Admiralty to buy two aeroplanes and to send to Eastchurch twelve naval ratings as the basis of a naval flying school. He also persuaded the Admiralty to sanction the building in Chatham Dockyard of a platform with a trackway from which aeroplanes could start from the decks of ships. This platform was set up on H.M.S. *Africa*, and early in December 1911 Lieut. Samson made from that platform the first successful flight in Europe from a ship.

Thereafter with the help of the late Mr. Horace Short he worked out a design for a seaplane. This machine was finished in March 1912 and on it he flew altogether about 150 hours without damaging anything. During this year he was a member of the Technical Sub-Committee which prepared a detailed scheme for the formation of a British Aeronautical Service to be known as the Royal Flying Corps. And early in 1912 he was appointed to command at Eastchurch, pending the establishment of the Central Flying School.

At the end of 1913 he was already doing experiments in night flying. And in the same year he flew an aeroplane off H.M.S. *Hermes* during naval manœuvres. In 1912-13 he was experimenting with bomb-dropping at Eastchurch, and in 1913 he commanded a flight of aeroplanes at the Review of the Royal Navy by the King at Spithead.

On the outbreak of War in 1914 he was ordered to establish a base at Skegness and to take charge of the patrol of the coast from the Humber to Cromer, but shortly afterwards he flew to Ostende with his Eastchurch Squadron, where they made reconnaissances over Belgium. Thereafter, when the German Army were in process of occupying the South and West of Belgium he organised a fleet of armed and armoured motor-cars and performed exploits with them which unhappily came back to the London newspapers and made him a hero of the Press. From this early popularity he has never been able to free himself, and throughout his Service career, no matter how carefully he might guard his movements, he has always been unwillingly in the newspaper spotlight.

Certainly, no man ever better deserved to be a hero among those who served under him. Charles Samson was not only one of the finest pilots during the War but he was one of the bravest, for, unlike some pilots who have acquired fame by their exploits, he knew fear and overcame it, which is at once the penalty and the reward of having an imagination.

After serving at Dunkirk until February 1915 his Unit was withdrawn to Dover and he was there ordered to organise a fresh Unit to help the Fleet and the Army in the Dardanelles,—where no Army aircraft were then available. For his services in Flanders he had already been made a Companion of the D.S.O.

His Unit arrived at the Dardanelles just at the time of the first landing and led by him did extraordinarily fine work.

Later, in the aircraft-carrier *Ben-my-Chree*, which he took over from Commander l'Estrange Malone, he did equally notable work with seaplanes, till his ship was unfortunately sunk by Turkish field guns in the harbour of Castellorizo. Thereafter he took over the aircraft carrier *Raven II* and explored the Indian Ocean with seaplanes in search of German submarines which were laying mines in the mouths of the Indian harbours.

In November, 1917, he was appointed to command the Naval Air Station at Great Yarmouth, and all who served at that station during his command can tell unlimited stories of his personal gallantry and of his curious but highly effective methods of inspiring his men. Something of his work is told in *The Story of a North Sea Air Station*, by Mr. Snowden Gamble.

In October, 1918, he was appointed to command a Group at Felixstowe as a Group Captain. In January, 1921, he was promoted Air Commodore. In 1920 he was Chief Staff Officer at H.Q., Coastal Area, and in 1921 he was appointed to command the R.A.F. in the Mediterranean. In 1922 he was posted to No. 6 Group Kenley, and in June, 1926, he was appointed Chief Staff Officer, H.Q. Middle East, at Cairo.

In September of that year he himself led the Service flight of Vickers Victorias which made a notable cruise from Heliopolis to Aden and back. In May, 1927, he led the annual flight of Fairey biplanes from Cairo to the Cape and back.

In August, 1927, he was placed on the half pay list. Since then he has had a very severe illness from which he has made an extraordinary recovery,—but when one last saw him on the day of the Schneider Contest he was still looking very unlike the robust fighting man who led so many of the R.N.A.S. in desperate undertakings.

Decorations are not always a measure of the gallantry of the individual, but the decorations won by Charles Samson rather under-rate than otherwise his exceptional gallantry. A list of them may well be placed on record. Beginning with the African General Service Medal with a clasp for Somaliland 1908-10, and the three regular medals for the War 1914-18, he was appointed a Companion of the D.S.O. in 1914. He was made an officer of the Legion of Honour, France, in January, 1916, and in March, 1916, he was awarded the Croix de Guerre. In January, 1917, he was given a Bar to his D.S.O. And in January, 1919, he was awarded the A.F.C. Lastly he was created a C.M.G. in June, 1919. But there are many men who have been given the Victoria Cross for individual acts of less bravery and there are few men who have continually set such a high standard of gallantry.

As a Commanding Officer from his earliest days Charles Samson never asked an officer or a man to take a risk which he did not take in a greater degree himself. In his earliest days he flew strange aircraft of unknown habits, many of which were distinctly dangerous. When seaplanes were first built he flew them before asking anybody else to take the risk. In action, whether over land or over sea, he himself was always in the most dangerous place. His natural gift for leadership is best proven by the fact that to-day there is hardly a man who served under "Sammy," as he was familiarly called behind his back, who would not turn out and follow him again if physically capable of doing so.

Air Commodore Samson is still young, and he has "enterprise and shrewdness,"—as an Official Despatch of September, 1914, said of him. His many friends in the Service will hope that these qualities may bring him success in whatever business he may choose to follow.

Air Vice-Marshal Sir Oliver Swann.

Air Vice-Marshal Sir Oliver Swann, K.C.B., C.B.E., was born in 1878 at Wimbledon. He was educated at Elstree, and in *H.M.S. Britannia*, and at the Royal Naval College. He joined the Navy in 1895.

As a Commander, R.N., he was appointed in 1910 to help in the construction of the Navy's first rigid airship, built at Barrow-in-Furness, which was known derisively as *H.M.S. Mayfly*. While in this appointment he began to take a lively interest in heavier-than-air craft. In 1911 he bought from A. V. Roe and Co. Ltd., one of their earliest biplanes with a small Green engine and had it fitted with floats.

Although he was not a qualified aviator, he pluckily tried to fly it off the water at Barrow. The machine left the water but unfortunately slid backwards into it and was wrecked. Thus he acquired the distinction of being the first British aviator to leave British water in a seaplane.—though the manner of his descent deprived him of the honour of being the first Naval aviator.

Nevertheless, to him belongs the credit of being the first private owner of a seaplane and certainly of being the first Naval officer to get off the water in a seaplane.

Quite undefeated by the mishap to his seaplane and by the failure of the airship, Commander Schwann, as he then was, learned to fly on a Bristol biplane over Salisbury Plain. His Royal Aero Club certificate, No. 203, is dated April 16, 1912.

About that period he was appointed Second in Command to Captain Murray Sueter, Director of the Air Department of the Admiralty. And so he was one of the prime movers, first of all in the formation of the Naval Wing of the Royal Flying Corps, and later of the Royal Naval Air Service, which came officially into being on July 1, 1914.

In the early days of the War Commander Schwann came near to losing his life at the hands of British troops. Not long before the War the R.N.A.S. had bought from the Mars Flugzeugwerke of Leipzig a biplane of considerable promise. In this machine Commander Schwann and Lieutenant Collet, R.M., were flying up to Scotland on some business connected with the Grand Fleet, when they were forced by engine failure to land at Scarborough Race Course.

The Race Course was at that time occupied by a detachment of Territorial Infantry, all of whom were firmly convinced that the German Fleet was to land the German Army at Scarborough within the next hour. The whole country at the period was crazy with spy-mania, and anything that suggested German origin was liable to be destroyed at sight.

The mental state of the country was, as usual, perfectly indicated by *Punch* when it announced that the name of "Jermyn Street" was *not* to be changed.

When the Mars biplane landed it was promptly surrounded by Territorials, with their fingers twitching on their triggers. The occupants of the machine descended. They spoke perfect English, but they wore leather coats over blue uniforms,—and all Germans were known to wear blue uniforms. A territorial officer arrived. He saw the damning name "Mars Flugzeugwerke, Leipzig" in German on a brass label on its side.

One of the captured officers claimed to be a Commander in the Navy, and to prove his case presented to the Territorial officer a card bearing the name Commander Oliver Schwann, R.N. There was very nearly a double death on the spot. But the Territorial officer was persuaded to keep them under arrest till investigations had been made.

At that time there happened to be in Scarborough a young amateur aviator named Gaskell Blackburn who had tried to get himself accepted for the Royal Naval Air Service and had been refused. Being a native of those parts he knew several of the authorities in Scarborough, and he also happened to recognise the machine which had come down on the Race Course. So he dashed up to the Race Course and found what had happened

He added his arguments to those of the captured officers, and in due course was able to communicate with the Scarborough authorities, who enabled them to communicate with their headquarters in London, and so their lives were saved.

Young Mr. Gaskell Blackburn is now quite well known as a Wing-Commander, R.A.F., for he managed to get himself accepted for the R.N.A.S. and afterwards distinguished himself in East Africa and in Mesopotamia. Then or thereabouts Commander Schwann, like so many other people who bore names with a German appearance, changed his name and henceforth was known as Swann.

In April 1915 Captain Oliver Swann, R.N., as he had then become, took over command of the aged Cunard Liner *Campania*, equipped her with about a dozen seaplanes and joined the Grand Fleet at Scarborough. There was a legend in the Grand Fleet that the old *Campania* was chiefly held together by her successive coats of paint,—but hold together she did and managed to do some very good work. Owing to an unfortunate accident the *Campania* did not take part in the Battle of Jutland but she and her seaplanes did a great deal of valuable scouting work in the North Sea.

Early in 1918 Captain Swann took command of the *Icarus*, which was also used as a seaplane carrier. In April 1919 he commanded the R.A.F. Mediterranean Area, with Headquarters at Malta. In 1921 he was Director of Personnel at the Air Ministry and in 1922-23 he was Air Member for Personnel on the Air Council.

In November 1923 he was appointed Air Officer Commanding Middle East at Cairo, which post he held until November 1926. Since then he has been on the half-pay list,—and now retires automatically.

THE DO.X.

Dr. Dornier gave some interesting figures relating to the Dornier Do.X during the 18th meeting of the German Scientific Association for Aviation in Berlin on Nov. 6.

Dr. Dornier stated, according to *The Times*, that the Do.X offered the best prospects of profit in its present form if employed on stretches between 1,000 and 1,500 kilometres (roughly 600 and 900 miles). Dr. Dornier calculated the running costs, inclusive of everything save capital outlay, at two marks per ton-kilometre on a 1,000-kilometre run, with a yearly aggregate of 75,000 kilometres (45,000 miles).

He gave examples of routes on which such a machine could be profitably employed; for instance, it could carry about 12½ tons of useful load on the 120-mile stretch between New York and Atlantic City; nine tons, or 95 passengers, on the 450-mile run between Marseilles and Algiers.

The tons mentioned are probably metric tons (2,205 lbs.) The figure of two marks per ton-kilometre is equivalent to about 3s. 3d. per ton-mile.

ITALY'S GIFT TO BRAZIL.

On Nov. 9 the Rome correspondent of *The Times* stated that the Italian Government had decided to present the Savoia S.64 to the Brazilian Government.

This is the monoplane with the 550 h.p. Fiat A.22 on which Capt. Ferrarin and Major del Prete made a World's record by flying from Rome to Natal on the Brazilian coast, a distance of 5,062 miles. The date of the flight was July 3-5, 1928.

The recent flight of Costes and Bellonte from Paris to Manchuria has surpassed this distance, and is likely to receive homologation as the new record for distance.

DOPED WITH

Gloster Survey "Bristol Jupiter XI."

CELLON

The dope of proved efficiency

Gloster Survey machine, designed and built by the Gloster Aircraft Co. to the order of the Aircraft Operating Co. Ltd.

This is the first machine ever designed specially for Air Survey work, and was exhibited in skeleton form at Olympia. The machine has now been completed and doped with Cellon.

Cerric Cellulose Lacquers comply with D.T.D. Specifications for metal parts, cockpits, propellers. Particulars on application.

CELLON, LTD., Upper Ham Road, KINGSTON-ON-THAMES.

(Contractors to H.M. and Foreign Governments.)

Telephone: Kingston 6061 (5 lines). *Telegrams: "AJAWB, 'Phone, Kingston-on-Thames."*

AIRSHIP NEWS.

R.101.

On Nov. 9 the R.101 made her fifth test flight. This was remarkable for the fact that 82 people were on board. This is the largest number ever carried by a British aircraft, and is half the number recently carried by the Dornier Do.X flying-boat. The passengers were mostly technical people from the Air Ministry.

THE VINDICATION OF THE R.101.

During the gale of Nov. 11 which continued during the night to Nov. 12, the R.101 rode at her mooring-mast quite satisfactorily.

The wind rose to an average of 70 m.p.h. during the afternoon of Nov. 11 with gusts of 83 m.p.h. The maximum load on the coupling however never rose above 12 tons. The designed breaking load is 30 tons.

During the recent severe weather Storm Routine has been in force. This entails a complete watch on board the airship, another standing by at the base of the tower and another within call.

When the R.33 broke away from her mast at Pulham the wind did not exceed 45 m.p.h.

The improved method of mooring the new airship must now be considered as having been well tested. The R.101 was better at the mast than loose because with her present engine equipment working full out she would have progressed backwards in the gale of Nov. 11 at speed of from 3 to 13 m.p.h.

A PARLIAMENTARY LOTTERY.

Eighty places for a flight in the R.101 were recently allotted to the House of Commons. There was a certain amount of Parliamentary excitement over this adventure, and 159 members applied for seats. As a result of this enthusiasm, and presumably so that honourable members might not be seen queueing up for a seat or attempting to become stowaways, a ballot was arranged. The draw was made under the supervision of the Speaker on Nov. 6.

Forty of the successful applicants are Labour members, thirty-one are Conservatives, and nine are Liberals. There are three women, Lady Astor, Dr. Ethel Bentham, and Dr. Marion Phillips. Mr. Montague, the Under-Secretary for Air, also won a place.

One can only hope that R.101 may not emulate that famous Italian triplane which, during the War 1914-18, took up a load of 12 or 18 Italian journalists and shed its wings at 5,000 ft. or thereabouts.

THE COST OF THE AIRSHIPS.

In the House of Commons on Nov. 6 in reply to a question by Sir J. Power, the Under-Secretary of State for Air said that the cost of the R.101 had been given in the Air Estimates as £527,000. The figures of the actual cost were not yet available but would probably slightly exceed this total. The contract price of R.100 was £350,000 with an option of re-purchase to which a precise money value could not be assigned. He was not in a position to state how much the contractor had spent on her construction.

AIRSHIP PROSPECTS.

In the House of Commons on Nov. 6, in reply to a question by Mr. Malone, the Under-Secretary of State for Air said that until the Airship R.101 had completed her preliminary trials he was not in a position to give any definite date for the projected flight to India.

In reply to a further question by Mr. Malone, Mr. Montague said that assuming that the airships R.100 and R.101 passed their trials satisfactorily, they should prove suitable (subject possibly to some minor modifications) for experimental operation and demonstration flights to the Dominions. A regular service could not be established with only two airships.

AIRSHIPS AND PARACHUTES.

In the House of Commons on Nov. 6, in reply to a question by Mr. Day, the Under-Secretary of State for Air said that fifty parachutes had been carried on the trial flights of H.M. Airship R.101. The officers and crew had been fully instructed in the use of these parachutes and although it was not possible, for obvious reasons, similarly to instruct passengers, no real difficulty should be experienced in the use of the parachutes by anyone.

[Mr. Montague's reply was somewhat ambiguous. In the first place what is the use of the officers understanding the use of parachutes if the passengers do not? What are the "obvious reasons" which make it impossible to instruct passengers in the use of parachutes? One does not have to do a practice jump to understand the mechanism of the thing. The official instructions given to civilians travelling in Service aircraft are roughly: "Here is the ring. On the command 'Jump' you get over the side, jump, count three, and pull the ring." Even journalists are not required to do a practice jump. Further to this, if parachutes are really needed, or would be any use in airships, they should be worn, or at least the harness should be worn, with the pack in an easily accessible spot, by every member of the crew and by every passenger. The harness of the parachute has to be adjusted to fit the individual before it can be buckled on. At sea any passenger can pick up any life-belt and put it on, but heaven help the outsize passenger who, in case of emergency tries to get into the parachute harness of the smallest-sized passenger.—C. M. MCA.]

THE FIRST RIVET.

On Nov. 7, at the works of the Goodyear Zeppelin Company in Akron, Ohio, Rear Admiral Moffett fastened a gold rivet in the largest ring of the new American airship ZRS.4.

This ceremony, marking the first step in the construction of the airship, was intended to be similar to the laying of a keel-plate in a shipyard.

The ZRS.4 is designed to be the largest airship in the World, with a capacity of 6,500,000 cub. ft., as compared with the 5,000,000 cub. ft. of the R.101.

AN AIRSHIP CHANGE.

The Airship Development Co. Ltd. claim that their new pilot, Mr. Beckford Ball, flew more hours than any other pilot in the R.A.F. airships of the S.S. and S.S.Z. types. His pilot's certificate as an airship pilot is No. 14. Many of his contemporaries took charge of bigger ships after qualifying as pilots, but Mr. Ball remained true to the Blimp.

Air Ministry trials of the A.D.1 have been made at Cramlington recently under the supervision of Captain G. F. Meager from the Royal Airship Works at Cardington. The trials were quite satisfactory, and probably by the time these notes appear the ship has been certified as airworthy.

A LITHUANIAN ZEPPELIN HANGAR.

The Zeppelin hangar which the German military occupants of Lithuania erected on the present site of the Kaunas Aerodrome has been sold by public auction. It was bought by the merchant Salmuk, who paid Lits. 155,000 for it. Mr. Salmuk intends to dismantle the hangar and to sell the iron contents, about 1,800 tons, for remelting.

HONOUR WHERE DUE.

In some preliminary notes on the Aerodrome Conference which was organised by Sir Alan Cobham and Sir Charles Wakefield on Nov. 5 one expressed doubts whether the Royal Aeronautical Society, the Royal Aero Club and the Air League of the British Empire, in whose names the invitations of the Conference were sent out, had paid for so much as a postage-stamp. One has been severely taken to task for having these doubts, or at any rate for putting them into print.

Closer investigation has produced the assurance that in fact all the preliminary letters to municipal authorities referring to the proposed Conference were sent out by the Royal Aeronautical Society on the printed note-paper of that Society. And as in fact such communications were sent to about five hundred individuals the amount of paper, envelopes and postage-stamps must have been quite considerable.

Considering that a copy of THE AEROPLANE and a covering letter were sent to each of those same individuals from this office we here are able to sympathise with the Royal Aeronautical Society.

Apart from such routine work as was done by his staff, the Chairman of the Royal Aeronautical Society, Colonel the Master of Sempill, did an enormous amount of work in connection with the Conference. He acted as Chairman at the Conference, and conducted the proceedings with his usual tact and judgment. Also he deputised for Sir Sefton Brancker in welcoming the visitors. And in many other ways he helped forward the good cause.

On the other hand, one regrets that one cannot recall seeing at the Conference many of those important personages whose names figure so impressively in the Society's publications, although quite a fair number of them appeared afterwards at Sir Charles Wakefield's banquet. One cannot help feeling that if more of the important people in British Aviation had absorbed mental sustenance from the excellent papers which were read at the Conference, even at the cost of denying themselves the pleasure of Sir Charles Wakefield's hospitality, if their time was too valuable to allow them to attend both functions, we might in future have looked forward to their helping the development of British Aviation with a better understanding of the problems before it.—C. G. G.

A BACK NUMBER WANTED.

Will any readers who have copies of THE AEROPLANE of August 28, 1929, which they no longer need send them to the Editor, THE AEROPLANE, 175, Piccadilly, W.1, as this issue is out of print and several readers urgently require copies of that number.

END OF COMPETITION SEASON
SOME NOTABLE GIPSY MOTHS FOR DISPOSAL

BY THE MANUFACTURERS

G-AAHR. Special two-seater racing Moth with standard Gipsy engine. Winner of Zenith Cup, averaging 112½ m.p.h., including all stops, over 1,150 mile circuit of France. Top speed 124 m.p.h. Streamlined coupe head and special racing undercarriage. Petrol capacity 24 gallons. Equipment includes Oil Thermometer, Compass, D.H. Harness, Double-acting Vickers Hand Pump for petrol. Faired and streamlined throughout for maximum performance. C. of A. to June, 1930. Price £575

G-EBQH. A high performance two-seater Moth, the property of Mr. A. S. Butler, Chairman of The de Havilland Aircraft Company Limited. Fastest time for light aircraft in King's Cup Race, 1929. Top speed 120 m.p.h. Standard Gipsy engine, racing undercarriage, Compass. Faired and streamlined throughout. C. of A. to September, 1930. Price £575.

G-EBTD. (*The Reliability Tour Moth.*) The identical Gipsy Moth which has just concluded the record total of 600 flying hours with completely sealed engine. Aircraft and engine now completely overhauled and reconditioned throughout. Telephones fitted. C. of A. for 12 months. A chance to acquire a machine which has made flying history Price £425.

G-AARE. Used for tests only. Total flying time 4 hours. Fitted with slots and telephones. This machine is practically brand new and for sale at £665.

G-AALJ. Used few demonstration flights only, and as new Total flying time less than 3 hours. Completely equipped, including such extras as Slots, Slot Locking Device, D.H. Harness in both cockpits, Compass, Telephones. Special price £700.

To be viewed at any time by appointment.

METAL COATING

Coating Firebox of Locomotive with Aluminium

for Permanent Protection!

This Pr cess is being used with great success by the leading industrialist: in many countries for eatings o Lead, Tin, Zinc, Aluminium, Copper, Nickel and other metals for prevention of Corrosion, Heat S ale and attac by Fumes or Chemical Action.

A proved necessity in the Engineering, Electrical, Chemical and other Trades.

The general utility of the Process is evidenced by the following selected list of users:—

Armstrong Siddeley Motors.
Winchester Repeating Arms Co., U.S.A.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, November 5.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Flt. Lt. G. H. Stainforth (Lt. The Buffs, R.A.R.O.) is granted a perm comn. in this rank (Oct. 1). The following Plt. Offs. are promoted to the rank of Flg. Off.:—D. B. McGill (with seniority of June 9) (June 16); J. A. Harris, C. P. Hanlon, L. H. Snelling (Oct. 8); H. H. Chapman (Oct. 13); M. N. Oxford (with seniority of Oct. 13) (Oct. 20).

The following Plt. Offs. on probation are confirmed in rank:— B. A. Blythe, A. L. Brain, C. M. D. Chambers, H. R. Collins, F. A. McNeill, G. O. St. J. Morris, K. W. Pell, A. F. Powell, R. A. R. Robinson (Oct. 2); A. H. Abbott, F. S. Barron, A. G. M. Cary, C. B. Field, E. G. Granville, H. L. McCulloch, R. M. Messiter, G. F. P. O'Farrell, R. W. Wallace, T. E. Whittome (Nov. 2).

Air Vice-Marshal A. E. Borton, C.B., C.M.G., D.S.O., A.F.C., is restored to full pay from half pay (Nov. 1).

Flg. Off. J. B. Mackenzie takes rank and precedence as if his appointment as Flg. Off. bore date Oct. 1. Reduction takes effect from Oct. 7.

Air Vice-Marshal Sir Oliver Swann, K.C.B., C.B.E., is placed on the retired list (Nov. 2).

The following are placed on the retired list at their own request:— Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C. (Nov. 2); Air Commodore T. C. R. Higgins, C.B., C.M.G. (Nov. 1); Flg. Off. L. J. Booth (Oct. 11).

Air Commodore C. R. Samson, C.M.G., D.S.O., A.F.C., is placed on the retired list on account of ill-health (Nov. 6).

Flg. Off. L. A. Egglesfield is transferred to Reserve, class A (July 8). (Substituted for the notification in the *Gazette* of July 9.) Plt. Off. on probation R. R. Maxwell-Channell relinquishes his S.S. comn. on account of ill-health (Oct. 29).

Plt. Off. B. S. Bramble is cashiered by sentence of General Court Martial (Oct. 9); Plt. Off. J. D. Robertson is dismissed the Service by sentence of General Court Martial (Oct. 26).

MEDICAL BRANCH.—W. S. Stalker, M.D., D.P.H., is granted a temp. comn. as a Flt. Lt. with effect from and with seniority of Oct. 21. The S.S. comns. of the following officers are antedated to the dates stated:—A. L. St. A. McClosky (Sept. 1, 1926); R. Thorpe (Sept. 2, 1926); L. O'Connor, M.B. (Aug. 2, 1927); J. C. Neely, B.A. (Nov. 11, 1927); P. B. L. Potter, M.B. (Mar. 5, 1928); J. L. Groom (April 2, 1928).

Flg. Off. L. O'Connor, M.B., is promoted to the rank of Flt. Lt. (Aug. 2); Flt. Lt. (Acting Sq. Ldr. Hon. Wing Cdr.) J. N. MacDonald is promoted to the acting rank of Wing Cdr., with pay, whilst so employed (April 1); Flg. Off. A. L. St. A. McClosky is promoted to the rank of Flt. Lt. (Sept. 1, 1928) (substituted for the notification in the *Gazette* of Feb. 5); Flg. Off. R. Thorpe is promoted to the rank of Flt. Lt. (Sept. 2) (substituted for the notification in the *Gazette* of Mar. 5); Flg. Off. E. A. Wilson, M.D., relinquishes his S.S. comn. on account of ill-health (Oct. 17); Flg. Off. V. G. Pedley (Temp. Lt., General List, Army, Dental Surgeon) relinquishes his temp. comn. in the R.A.F. on completion of service (Oct. 18).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—C. Langley is granted a comn. in Class A as a Plt. Off. on probation (Oct. 21). The following are granted comns. in Class A as Flg. Off. on probation (Sept. 10):—E. K. Wallis, J. W. Rayner. The following are granted comns. in the Special Reserve as Plt. Offs. on probation (Oct. 14):—R. A. Hall, W. F. Pharazyn.

The following Flg. Offs. are promoted to the rank of Flt. Lt. (Nov. 1):—C. H. A. Farnan, H. M. Schofield, E. H. Fielden, A.F.C., A. L. Macmillan, A. D. McDowall, C. S. Staniland, I. W. C. Mackenzie.

The following Plt. Offs. are promoted to the rank of Flg. Off.:— G. R. De Havilland (Oct. 30); E. P. Swallow (Nov. 2). Flg. Off. E. V. Culverwell is transferred from Class A to Class C (Nov. 5); Flt. Lt. M. Ballard is re-employed with the Regular Air Force for a further year (Nov. 1).

Armistice Day.

A detachment of the Royal Air Force formed part of the Guard of Honour at the Armistice Day Ceremony at the Cenotaph, Whitehall, on Nov. 11. Trumpeters of the Royal Air Force sounded the Last Post at the end of the Two Minutes' Silence.

Marshal of the Royal Air Force Sir Hugh Trenchard, Chief of the Air Staff, laid a wreath on the Cenotaph on behalf of the Royal Air Force.

The representative detachments of ex-Service men and women present at the Ceremony included a contingent of the Women's Royal Air Force. A wreath was laid, on behalf of the W.R.A.F. Old Comrades' Association, by Miss Spinney.

The Royal Air Force Memorial.

A short ceremony to celebrate the anniversary of the signing of the Armistice was held at the R.A.F. Memorial, Thames Embankment, on Nov. 10.

A wreath was laid on the Memorial on behalf of the R.A.F. Memorial Fund by Air Marshal Sir John Higgins, K.C.B., K.B.E., D.S.O., A.F.C. Other representative wreaths were from the Government and People of Australia, the Royal Canadian Air Force, the Permanent Air Force of New Zealand, the South African Air Force, and the Women's Royal Air Force, Old Comrades' Association.

Foreign Decorations.

His Majesty the King has given authority for the wearing of the following decorations conferred upon officers of the British aircraft-carrier *Eagle* by the King of Spain in recognition of valuable services:—

ORDER OF NAVAL MERIT.

THIRD CLASS.—Capt. Noel Frank Laurence, D.S.O., R.N.

SECOND CLASS.—Cdr. Humphrey Maurice Robson, D.S.O., R.N.; Wing Cdr. Roger Martin Field, R.A.F.; Eng.-Cdr. William Frederick Paffett, R.N.

FIRST CLASS.—Lt. Robert Rule Graham, R.N.; Lt. Ian Mackenzie Martineau, R.N.; Lt. Anthony Cuthbert Guy Ermen, R.N.; Lt. Brian Harold Maule Kendall, R.N.; Flt. Lt. Bryan Vernon Reynolds, R.A.F.; Flt. Lt. Harold Hunter Down, R.A.F.; Flg. Off. Edward George Lambert Russell, R.A.F.; Flg. Off. Arthur Pakenham Fitzhardinge Murray Berkeley, R.A.F.; Lt. Hugh Percival Brister, R.N.; Lt. Edward Owen Unwin, R.N.

The Royal Air Force Staff College.

In the House of Commons on Nov. 4, in reply to a question by Major Pole, the Under-Secretary of State for Air said that the numbers of Indian Army and Dominion officers who had received training at the R.A.F. Staff College were as follows:—

Indian Army, 1926, 1; 1927, 1; 1928, 1. Royal Canadian Air Force, 1926, 2; 1927, 2; 1928, 2. Royal Australian Air Force, 1926, 2; 1927, 2; 1928, 2; South African Air Force, 1928, 1.

No charge was made against the Government of India in respect of Indian Army Officers trained at the R.A.F. Staff College in view of the provision by that Government of reciprocal free training at the Staff College, Quetta. Payment was made by His Majesty's Governments in Canada and in Australia at the rate of £400 a year in respect of each officer under training. The actual receipts during the period covered by the three financial years beginning on April 1, 1926, and ending Mar. 31, 1929, had been as follows: Australia, £2,350; Canada, £1,358; South Africa, £496.

The World's Fastest Aircraft.

The Supermarine-Rolls-Royce S.6, in which Flg. Off. Waghorn won the Schneider Trophy and Sq. Ldr. Orlebar broke the World's speed record, is now on view at the Science Museum, South Kensington.

Since the contest the machine has been used to advertise a newspaper and the public who paid for the machine have been charged by that newspaper to see it.

At South Kensington admission is free daily, and a large number of people have already seen the S.6 there. It is immediately inside the entrance in Exhibition Road and is mounted at the end of a gallery opposite the Wright biplane.

It will remain in London until the end of the year.

The Schneider Trophy.

In the House of Commons on Nov. 6, in reply to a question by Lt.-Cdr. Kenworthy, the Under-Secretary of State for Air said that the decision of the Government to leave the entry for the Schneider Trophy to private enterprise had been taken on grounds of principle and policy and not on a calculation of the probability of private entries. He would point out that until 1927 the responsibility for British participation had been undertaken by private enterprise. The Government felt that the existing conditions created by two British successes should make the resumption of the former tradition quite practicable.

The Kenley Collision.

Two Gloster Gamecocks of No. 23 (Fighter) Squadron, R.A.F., collided over Wallington (Surrey) on Nov. 7 in the course of fighting training operations. The accident occurred at 14.30 hours at a height of about 5,000 feet and the pilots of both machines, Flg. Off. R. S. Collins and Sjt. S. L. White, escaped by parachute and landed without injury.

One of the machines fell onto a house in Ross Road, Wallington, and set it on fire. The other machine fell onto a shed at the back of a shop in Desmesne Road, Wallington, and did comparatively little damage. Both machines caught fire on striking the ground.

The Armoured Cars in Palestine.

In the House of Commons on Nov. 5, Brig.-Gen. Brown asked the Secretary of State for War whether, seeing that the mechanised armoured car squadrons of the Cavalry and Royal Air Force, used recently for the restoration of law and order in Palestine, were handicapped by punctures, which were practically the cause of all their breakdowns, a satisfactory tyre had yet been found to stand the weight of these cars in rough country or were they still being shod

Digitized by Google

with the same tyres. Mr. Shaw said that as a result of the experience of the mechanised armoured car squadron recently in Palestine, steps had been taken to re-equip that squadron with a type of tyre less susceptible to puncture.

[Perhaps Brig.-Gen. Brown will explain what a non-mechanised armoured car would be like.—C. G. G.]

Another Auxiliary Squadron.

Colonel G. H. Stobart, D.S.O., speaking at a meeting of the Durham County Territorial Army Association, recently, said that the Association had been approached by the Air Ministry with a view to raising a Squadron of the Auxiliary Air Force. Colonel Stobart said that the Association was to be congratulated on having been entrusted with the task of forming the Squadron and would proceed with the work on receipt of Air Ministry authority. The town headquarters would be in Sunderland and the aerodrome would probably be on the old war-time site at Usworth.

The Air Estimates for 1929 allowed for an increase of three Auxiliary Squadrons during the financial year which ends in March, 1930.

Central Flying School Categories.

The following officers and airmen have been re-categorised (Central Flying School) as from the dates stated against their names:—

A.2 to A.1:—Flt. Lt. D. M. Fleming, Sept. 19; Flg. Off. E. J. George, Sept. 24; Flg. Off. G. H. W. Selby-Lowndes, Oct. 18; Flg. Off. C. H. G. Brembridge (R.A.F.O.), Sept. 19.

B. to A2:—Flt. Lt. G. C. A. Armstrong, Sept. 24; Flg. Off. L. H. Mason, Sept. 19; Plt. Off. L. R. S. Freestone, Sept. 19; No. 335376 Sjt. Darling, J. T., Sept. 24; No. 326166 Sjt. Bullmore, A. G., Sept. 19.

The following officers have been categorised as "B" instructors as from the dates stated against their names:—

Flt. Lt. T. S. Horry, D.F.C., A.F.C., Oct. 22; Flt. Lt. T. M. Williams, M.C., D.F.C., Sept. 20; Flg. Off. J. A. C. Florence, Sept. 12.

Service Transport for Airmen's Children.

An Air Ministry Order authorises the use, in certain circumstances, of R.A.F. transport for the conveyance of children of R.A.F. personnel to and from school where the school is at a distance from the Station and no public conveyance is available.

All the conditions in the Order having been observed, a charge is made of 2d. per child per day for the return journey.

George, the R.A.F.'s Robot.

The story of the American Robot aeroplane pilot in *The Evening Standard* of Nov. 7 has been received with mixed feelings by George, an older member of the Robot family who is at present serving with the Royal Air Force. George has been understood to say that although he has always shrunk from publicity himself and looks with horror on the notoriety which has fallen upon his American cousin, he would like to point out that he himself has been an air Ace for several years. Not only has he flown various types of aircraft for many thousands of miles but he is a flying-boat pilot of no mean order.

Other pilots in the Squadron to which George is attached say that it is quite untrue that George is a qualified air navigator. In fact he has proved himself to be a highly temperamental pilot and cannot be relied upon in an emergency. Replying to this charge in an interview George said that the truth was that when flying metal-hulled flying-boats the rest of the crew would leave him in charge of the controls while they went below to fry kippers on the primus stove. George considered that the smell of kippers, of which he was not offered a share, was bad for navigation and discipline, and accordingly he looped the flying-boat twice with the idea of calling the attention of the crew to their duties.

George added that it was only jealousy on the part of the other pilots that had prevented him from being chosen as the second pilot of the long-range monoplane which flew non-stop to India and is shortly starting off on another attempt to beat the World's record. As George points out he only weighs about 100 pounds and would, therefore, be eminently suitable for the job.

George's opinion of himself may possibly be lowered when he hears of the exploits of his young brother, who disappeared from this country some time ago, and was heard of recently in Southern Arabia, where, apparently, he has been flying for some months. Alfonso, as one believes he is called, needs no human pilot on board as senior officer. He is quite capable of looking after himself. However, being in the R.A.F., and consequently amenable to discipline, he prefers to fly in company with another machine, and to take his orders by wireless from it.

OCULI EXERCITUS.—The crest and motto of No. 6 (Army Co-operation) Squadron, R.A.F., carved in the living rock at Abu Saif on the Tigris just south of Mosul. The work was done by the airmen shown in the photograph, and was finished just before the Squadron left for Egypt after ten years in 'Iraq. No. 30 (Bomber) Squadron is taking over the Mosul Station.

Sandhurst v. Cranwell.

The annual Rugger match between the Royal Military College, Sandhurst, and the Royal Air Force College, Cranwell, was played at Sandhurst on Nov. 9, and resulted in a win for Sandhurst by two goals and two tries (16 points) to one penalty goal and three tries (13 points).

The Cranwell team are to be particularly congratulated on giving such an excellent account of themselves. They had played a stiff game the week before against a R.A.F. representative team at Cranwell and had beaten the R.A.F. by 24 points to 19

The Sandhurst team were heavier and stronger in the scrum and had an exceptionally fine hooker All of which made Cranwell's task the difficult one of turning every attack into a counter-attack. This they did with hard, close tackling and a lively ability to snatch at unexpected openings.

Ten minutes from the start Coote kicked a goal for Cranwell from a penalty for off-side. Immediately afterwards Coote made ground with a fine burst of speed. He was closely followed-up by Walker, who got over for a try. The goal-kick failed.

A smart movement among the Sandhurst backs sent Lacey away at such a pace that he was just over the line before he was brought down. Cranwell brought the game back into the Sandhurst half and kept it there for ten minutes before Sandhurst got clean away for a scrum and Way ran round to score between the posts. Brooke converted the try. Cranwell kept up the attack until half-time, but failed to score.

In the second half the game became faster and more open, and after ten minutes Coote scored a brilliant try. Sandhurst at this time were getting the ball out of practically every scrum, but the Cranwell tackling was close. An attempt by a Cranwell player to drop a goal went just wide of the post. Way got another try for Sandhurst, which Brooke converted. Just before time Coote scored again for Cranwell, but failed to convert.

Woolwich v. Cranwell.

Rugger enthusiasts are reminded that the annual match between the Royal Military Academy, Woolwich, and the Royal Air Force College, Cranwell, will be played at Cranwell on Nov. 16, starting at 14.30 hours.

Association Football.

R.A.F. v. Hampshire.—Hampshire beat the R.A.F. at Aldershot on Oct. 30 by three goals to one. Hampshire owed their victory to their superiority in attack at the end of the game. The R.A.F. defence was good, but they did not last the game as well as did the County team.

Boxing.

A boxing match between the Imperial Services and the Police of Great Britain and Ireland was held at the Royal Albert Hall on Nov. 6. The R.A.F. fought in three matches and won one. The results were:—

Light-weight.—P.C. Ferguson (F Division) beat AC. Buchanan (R.A.F.) on points.

Welter-weight.—Sjt. Wigmore (A.P.T. Staff) beat P.C. Bone (H Division) on points. Lance-Sjt. Dow (Cameronians) beat P.C. Barnes (K Division) on a casting vote.

Middle-weights.—P.C. Egan (R Division) beat AC. Clapp (R.A.F.) on a casting vote. Garda Chase (Civic Guards, Dublin) beat Lance-Sjt. Jamieson (2nd Batt., Gordon Highlanders) on points. Garda Ford (Civic Guards, Dublin) beat Gdsmn. Pughe (2nd Batt., C.G.) on a casting vote.

Light-heavy-weights.—P.C. Jackson (S Division) beat Lance-Cpl. Kennedy (2nd Batt., East Lancs. Regt.) on points. AC. Munkley (R.A.F.) beat Garda Murphy (Civic Guards, Dublin) on a casting vote. P.C. Allen (P Division) beat Lance-Sjt. Wood (2nd Scots Guards), the referee stopping the contest in the second round.

Heavy-weights.—Lieut. Gregson (R.N.) beat P.C. Titmus (A Division) on a casting vote. Signr. Stuart (R.C.S.) beat P.C. Clifton (Port of London Authority) on points. Gdsmn. Place (Grenadier Guards) beat P.C. O'Driscoll (Dublin), the referee stopping the contest after 1½ minutes as O'Driscoll had sustained a severe cut over the eye.

A SOUTH AFRICAN AIR FORCE DISPLAY.

A Display was given by the South African Air Force at Baragwanath, near Johannesburg, on Oct. 19.

The Display was preceded by a race for light aeroplanes over a course including Baragwanath—Roodeport—Johannesburg—Benoni—Germiston—Baragwanath, for a silver cup presented by the Mayor of Benoni to the Aero Club of South Africa.

The first event of the Display itself was a Message Picking-up competition between No. 1 Squadron, S.A.A.F., the Flying Training School and the Aircraft Depot. The machines used were D.H.9s (230 Siddeley Puma engine). This was followed by a demonstration of Balloon-chasing at a height of 1,000 ft. over the aerodrome.

An air combat between one D.H. 9 and two S.E.5as was the next event. The D.H.9 was armed with two guns and the S.E.s with one each.

A converging bombing exhibition was given by three S.E.5as (200 h.p. Hispano-Suiza engine). The bombs used were the ordinary practice type made of cement. No bomb-sights were used.

The S.E.5a was again brought into use for the Formation Stunting, when three of them looped, rolled and spun in formation.

Lesser events were an attempt to bomb a small car from a light aeroplane (one hopes the bombs were not cement in this case), a height-judging competition and an exhibition of parachute dropping.

Five D.H.9s and five S.E.5as took part in the formation flying. One machine of each type was in reserve. The machines are not fitted with R/T and therefore all orders were signalled by the leader of each squadron.

The 8th Infantry (Transvaal Scottish) co-operated with the Air Force in the Set Piece, which had the usual Arab village, reconnaissance aircraft, local troops, air attack and final bonfire of the rebels' stronghold.

The final event was a fly-past of all the types of aircraft in use in the South African Air Force. They were (1) Avro (Clerget); (2) D.H.9 (Siddeley Puma); (3) Moth (Gipsy); (4) Avian (Hermes); (5) Avian (Genet); (6) D.H.4 (Rolls-Royce Eagle VIII); (7) S.E.5a (Hispano); (8) D.H.9s (Jaguar IV) (9) M'pala (Jupiter VI); (10) Mantis (Jupiter VIII). The M'pala and the Mantis are modifications of other types.

Notes on the equipment of the S.A.A.F. in the Programme state that a definite decision has been made to adopt the Westland Wapiti as standard aircraft in the S.A.A.F. The first machine has already arrived and the type is being put into production in the S.A.A.F. workshops.

THE ROYAL AUSTRALIAN AIR FORCE.

The Times correspondent in Melbourne, in a message dated Nov. 8, states:—

Undeterred by criticism of its suspension of compulsory military training, the Commonwealth Ministry is proposing the discontinuance of the Royal Australian Air Force as a separate unit, contrary to the recommendations of Air Marshal Sir John Salmond after his visit last year to Australia, and without regard to the fact that Great Britain has abandoned the system under which the Army and Navy each had separate air services. This, with other proposals, will be considered by the Defence Council next week. The Ministry again advances the plea of economy.

The reversion to the old system is regarded with the strongest disfavour in the defence forces. It is unlikely that the civil aviation department will be affected, and it is also believed that the changes will not involve the Duntroon Royal Military College and the Jervis Bay Royal Naval College, except for a curtailment of expenditure.

A NEW ZEALAND RE-UNION.

A Re-union Dinner for New Zealand officers in the R.A.F. will be held in London on Saturday, Nov. 30. To ensure the success of this re-union it is essential that all New Zealanders should co-operate. For full particulars write immediately to Flg. Off. Alan Binley, R.A.F., Worthy Down, Hants.

WAR-TIME IN THE R.F.C.

[*Into The Blue*. By Captain Norman Macmillan, M.C., A.F.C. 231 pages, 9 in. by 5½ in., 11 illustrations. Duckworth. Supplied by The Aeroplane Book Department, Cannon House, Pilgrim Street, E.C.4. 9s. post free.]

Generally speaking, men who fought in the War 1914-18 may be divided into those who kept a diary and cannot or will not write a book, and those who would like to write a book but have never kept a diary. The exceptions are those who, having kept diaries, have written a book which never ought to have been written, and the very few, among whom is the author of *Into The Blue*, who has evidently kept some sort of a diary and has written an excellent book.

Norman Macmillan joined the Royal Flying Corps in December, 1916, after serving for some months in an Infantry Regiment in France. He was posted to Netheravon and learned to fly on a Maurice Farman Longhorn. Now that he is one of the most famous test pilots in the world it is particularly interesting to read his own vivid description of learning to fly, followed by chapters on the course at the Central Flying School at Upavon and later at the fighting and gunnery school at Turnberry.

After about three months' training he was posted to No. 45 Squadron in the Field. The Squadron was on the St. Marie Cappel Aerodrome, eight miles behind Bailleul on the Ypres front. His description of it is interesting:—

"The hangars were of the canvas and wood Bessoneau portable type, the quarters were Nissen Huts and the Mess was built of wood. I was received at the Squadron as every new man is in similar circumstances, with interest and kindliness, but without enthusiasm.

"A war-time aerodrome in France was often difficult to recognise at a casual glance. New pilots, on arrival, have been known to gaze around them at the trees and cornfields, and then ask ingenuously, 'Where is the aerodrome?'

"At which remark several dirty, oily-looking individuals, with faces bearing the unmistakable stamp of men who have been fighting, smile pityingly, and point out a small square field, bounded by two roads, three ditches, and one row of trees and hedge partly hiding the camouflaged hangars."

The Squadron was equipped with "One-and-a-half Strutters," a two-seater Sopwith biplane armed with a Vickers gun in front firing through the air-screw by means of a Ross gear, and a Lewis gun behind on a Scarff gun-ring. The Germans at that time were newly-armed with the Albatros Scout and were inflicting heavy losses on the British artillery-observation and reconnaissance machines.

Captain Macmillan's description of the work of No. 45 Squadron during the greater part of 1917 may be said to be typical of any squadron engaged on similar duties on that Front. With the exception of terse descriptions of certain incidents and some pieces of beautiful descriptive writing he has not stressed the off-duty life of the Squadron. He writes as a man for whom his job was everything. The concentration on the affair in hand, and the strict attention to detail which has made him an international authority on the art of flying, is shown in his descriptions of the organisation of the squadron, of the tactics of the patrols and of individual battles in the air.

One memorable paragraph describes the pilot's field of vision on a clear day. They were flying at 10,000 feet:—

"Straight below—although we were three miles east of the trench lines—lay the silver ruins of old Ypres, its stagnant moat and the stretching canals running ribbons across the country. Ahead was the coast of France and Belgium, with its yellow fringe of sandy foreshore. So close that it looked preposterous was Ostend, while further inland lay Bruges. To the right front the yellow fringe ran north for miles to the islands off the Dutch and German coasts.

"To the left front was the real wonder. There England lay, with that comforting shallow of green sea mirroring between. Her white cliffs stood out in prominence and the land swept away from the cliffs to right and left. To the left, dimly seen, lay the Isle of Wight; to the right the land ran out in a curving sweep around the Forelands before nestling back into the Thames Estuary, where it was lost in the haze which extended from Gravesend Londonwards. In the Channel a convoy of ships moved over the sea, a tiny, black destroyer foaming ahead of them in wide curves.

"The crack of a shell close behind us made me turn quickly. To the south the fighting line lay smeared across the fair face of France like the trail of a giant snail."

Perhaps the most wonderful story in the books concerns Pioneer Smith, who transferred from the Sappers to the R.F.C. as an air gunner. Captain Macmillan describes him thus:—

"From the first Gunner Smith proved a good fellow. His study of the flying journals helped him to recognise the different types of machines in the air. He quickly distinguished the Hun from the friendly, if inquisitive, scout. And, above all, he learned to hold his fire until he had a good target. His nerves were not of a sort which causes a man to blast off at long range to warn the Hun that the bus carried a sting in its tail. When he did shoot he shot straight. He shot to kill.

"He went up with an old and experienced pilot for his first few jobs of work, and very soon he was considered perfectly safe to go up with a new pilot to ensure his safety."

The story of the patrol in which Gunner Smith won the D.C.M. is an epic and to appreciate it to the full it must be read as Captain Macmillan has written it. To attempt to reduce it to the limits of this review would be to spoil it.

In August, 1917, No. 45 Squadron was re-equipped with Sopwith Camels.

"The first Camel was used as a practice mount and the older pilots of the Squadron flew it in rotation. Before anyone flew it the C.O. insisted on his first learning to spin and recover from the spin on the One-and-a-half Strutters, a wise precaution that doubtless played a large part in the complete absence of accidental casualties during the change-over period. The Camel was a fierce little beast. She answered readily to intelligent handling, but she was utterly remorseless against brutal or ignorant treatment."

Captain Macmillan, like many other pilots, learned a lot about flying from the Camel.

In November, 1917, No. 45 Squadron was one of the three British Scout Squadrons selected to reinforce the Italian front after the Battle of the Isonzo. The Squadron flew to Fienvillers where the machines were dismantled and packed. The adaptability of the R.F.C. is well illustrated in the description of the trek into Italy:—

"Two trains were requisitioned for our needs and our planes were loaded on waggons. Small, antiquated carriages provided accommodation for officers and senior N.C.O.s, horse wagons for the men. Our transport and stores were loaded on trucks, and the transport drivers and mechanics travelled in their own tenders and lorries. We installed camp cookers in a horse wagon, which we turned into a travelling kitchen by rigging temporary chimneys through the open doors. We placed the workshop lorry on a convenient truck behind the waggons for the men, wired their waggons and the officers' compartments, and lit them from our own electric plant."

By the end of December the Squadron had settled down on the Caproni aerodrome at San Pelagio and had tested their machines. A few days later they flew to the Istrana aerodrome and became part of the 51st Wing, R.F.C. The weather was bad and the country over which they flew was difficult but on the last day of the year they shot down two enemy Albatros scouts.

On January 6, 1918, Captain Macmillan became a casualty through the explosion of a tin of petrol which burned his face and almost cost him his eyesight. He continued to command his Flight, with a ten days' interval of acting in liaison with the anti-aircraft gunners on the Montebelluno Hill, until orders came for him to return to the Home Establishment.

Although Captain Macmillan left the Squadron he continues its war-time history in the book until its disbandment in December, 1919, and adds that of all the war-time Sopwith-equipped Squadrons, No. 45 holds the records for the greatest number of enemy planes brought down.

After a month's leave Captain Macmillan served at a number of Training Squadrons on the Home Establishment and eventually, in March, 1919, was posted to the new aerodrome at Chattis Hill in Hampshire. Before starting work as an Instructor he went through a course at the Gosport Special School of Flying.

He describes this famous R.F.C. School, which was commended by Lieut.-Colonel Smith-Barry, as the very first which reduced the art of instruction in flying to an exact science. On the methods practised there is based the famous system now in use at the Central Flying School, R.A.F. At the end of the course Captain Macmillan returned to Chattis Hill to instruct. There are some good stories about Chattis Hill. The author's impressions of the War are summed up in the last few lines of his book:—

"It was a good time and a bad time rolled into one, a picnic and a term of penal servitude combined, but it was a great and glorious adventure, too."

Into the Blue is about the best book dealing solely with the Royal Flying Corps which has yet been written. It reflects the spirit of a Corps which was half engineer and half soldier and yet managed to combine the best of both. It is not only an accurate and inspired history of a great Squadron but it is the history of the development of the art of flying under the stress of war.—C. M. MCA.

TURKISH DELIGHT.

A Turkish Military and Naval Commission is now in the United States inspecting aircraft factories and investigating the American Aircraft Industry generally. While in Los Angeles they visited the works of the Douglas Aircraft Co. and an informal ceremony of welcome was framed up.

Miss Bebe Daniels, who holds the title of Honorary Colonel in the 322nd Pursuit Group U.S. Air Corps Reserve was fully and immaculately garbed in the uniform of her honorary rank, plus wings and flying helmet, and acted as hostess. The Turkish officials were presented with silver and gold aviators' identification bracelets, and were advised by an "expert" on the particular type of aircraft best suited to Turkish service.

Photographs were taken showing a major and a lieutenant of the Turkish Army and Navy Air Services respectively with arms linked in those of the dressed-up movie star, and one presumes that a good time was had by all. Which, nevertheless, strikes one as a particularly undignified way of entertaining serving officers of any foreign Government.

AT THE AVRO WORKS.

BIG AND SMALL.—The Avro Ten (Armstrong Siddeley Lynx engines) and the Avro Five (Armstrong Siddeley Genet engines) side by side. —(*"Aeroplane" photograph.*)

A recent visit to Manchester gave one an opportunity of inspecting the works of A. V. Roe & Co. Ltd. and seeing how things are done in that part of the world.

The shops have quite a lot of work in hand, which includes the reconditioning of 504Ks and bringing large numbers of 504 Lynxes up to date by fitting them with new wings and Frise type ailerons.

As a novelty, however, the matters of greatest interest were the batches of metallised Avians and Avro Fives and Avro Tens now in production. These machines were exhibited at the Aero Show, but this is the first opportunity one has had of seeing them being constructed.

Since the Show, two or three Avro Fives have been ordered. One is now on its way to Kenya by air to form part of the equipment of Wilson Air Lines Ltd. Two others have been ordered by an unnamed firm for air survey work in the Sudan.

Five Avro Tens have been built and shipped to Australia, four for Australian National Airways Ltd. and the other for another concern in Queensland, Australia. Another four or five are now going through the shops.

As everybody knows, the Avro Company has acquired the licence to build the Fokker F.VII-3m for all parts of the British Empire with the exception of Canada. The Fokker method of construction, as is well known, incorporates the use of welded steel tube. At the outset, therefore, A. V. Roe & Co. Ltd. started in to find a steel that would suit their requirements for the job. After a lot of experimental work they decided on a steel to be known as R.O.1 for sheet, R.O.2 for bar, and R.O.3 for tube.

This specification conforms very closely to D.T.D.41, but has a low carbon and manganese content, as the Avro Company has found this necessary so as to avoid any trouble with hardening close to the weld. Before welding, this tube has a tensile strength of 30 tons and a yield-point of 28 tons. After welding the figures are 24 tons and 17 tons. As may be easily realised, fittings can be quickly formed from the combination of tube, sheet, and machined bar.

This material is used by the firm for the structures of Fives, Tens, and Avians, the descriptions of which follow under their respective headings.

AVRO TEN.

The Ten is a ten-seat, three-engined commercial, high-wing, cantilever, monoplane similar to the Fokker VII-3m.

The wing is attached to the fuselage by four bolts. In the Avro Ten the trailing edge has been made detachable along the entire length of the wing to make transport easier.

This wing is built up with two spars and a number of ribs. The ribs are further strengthened by a number of intercostal stringers running parallel to the spars and attached to each rib.

Over this a plywood covering is laid and fixed. This is finally covered with fabric and doped. The spars are of very deep section and have laminated spruce flanges, with webs of ply-wood. No lightening holes are used. The ribs consist of a ply-wood web with spruce booms sandwiching the web between them.

As these wings taper in chord and thickness every rib varies not only in depth and length but also in section, so the camber on

The wing of the Avro Ten, showing the ailerons and detachable trailing edge before being cut away from the wing.

THE AVRO TEN.—A side view of the British-built Fokker F.VII-3m which is built by A. V. Roe and Co. Ltd. and is equipped with three Armstrong Siddeley Lynx engines. —(*"Aeroplane" photograph.*)

Digitized by Google

the underside becomes more and more pronounced towards the wing tips.

The method of making and attaching the ailerons is delightfully simple. When the wing is complete, the ailerons are marked out and cut off. The trailing edge of the wing and the front edge of the aileron are filled in. Piano type hinges are then used to attach the aileron to the upper surface of the wing. The same method is used to make the trailing-edge detachable, but, in the latter case, the hinges are placed along both the upper and lower surfaces.

The only metal fittings in the wings are those for attachment to the fuselage, for slinging purposes, and the brackets for the aileron controls. The main wing fittings are simple channel-plates bolted through the spars with holes at their lower extremities to take the attachment bolts which pick up holes in the fuselage.

The fuselage consists entirely of welded steel tube. The structure is rigidly braced to a point aft of the cabin whence wire bracing is used to the tail. The well-known Fokker method of construction has quarter loops of small diameter tube welded in at each joint. Such additions not only act as stiffeners, but serve as anchorages for the bracing wires.

Wood fairing strips are bound along the outside of the fuselage and the whole is covered with fabric.

The passenger cabin is a ply-wood box fitted inside the fuselage as is the rear luggage compartment and the light luggage space beneath the pilots' seats.

The tail unit is of the normal monoplane type, with adjustable tail-plane and wire-braced fin. The whole of this structure is made of welded steel tube. For British airworthiness certification the tail-plane had to be strengthened to meet the conditions of a nose-dive at terminal velocity. This necessitates the use of axle tube of T.2 specification for the backwardly sloping front spar and the stiffening of its joint with the rear spar. The ribs are made from welded steel tube and are attached to sleeves on the spars as the material from which this is made cannot be welded.

The tail-plane is hinged at the rear spar to the fin-post and braced on the underside with one pair of struts to the fuselage. The fin-post is stayed with bracing wires which run from the outermost elevator-hinges to the top rudder-hinge.

The rudder and elevators, which are balanced, are also made of welded steel tube.

The undercarriage consists of two wheels on divided axles and a tail-skid. The wheels are fitted with wheel-brakes. Each half of the undercarriage consists of an axle and radius-rod hinged to the fuselage with a vertical Fokker type shock-absorber leg to the wing engine-mountings. This shock-absorber leg consists of a member sliding between two fixed members and all three are equipped with pegs round which rubber rings are passed. Differing loads are catered for by varying the number of rubber rings.

The tail-skid is a large diameter steel tube hinged and free to track. At its lower end is a hardened steel rubbing shoe. The top end has two sets of rubber shock-absorbers splayed out to each side of the fuselage.

The power-plant consists of three Armstrong Siddeley Lynx seven-cylinder air-cooled radial engines, all three of which are on detachable engine-mountings. The wing engines are slung on tubular mountings supported from two fittings on the front spar and one at the rear. The middle engine is detachable at four points from the body of the fuselage.

These engine mountings are all built on jigs and the lugs through which the engine-mounting bolts pass are so accurately positioned that their faces require no machining.

The engines are all fitted with hand turning-gear and starting magnetos which are in gear with the starting handle. The oil-tanks are mounted behind the engines. The fuel-tanks are placed in the centre-section of the wing. Two tanks are normally supplied, but provision is made for fitting another two to suit individual customers' requirements.

The fuel-tanks are novel in that they are made of riveted duralumin sheet, a method that many people have tried at various times. The success of the Avro method lies in the way the tanks are jointed.

The fuel lines run to a junction-box on a bulkhead at the rear of the pilot's cockpit.

The pilot's cockpit is situated under the leading edge of the wing whose under-surface is actually cut away to give increased head-room. In front is a three-sided wind-screen which slopes back into the wing at a very marked angle. The sides are open so that pilots can hang their heads over the side if they wish.

The ailerons are interconnected with a balance-wire running along the front spar. To explain the meanderings of the aileron-operating wires, the passage of the wire from one aileron to the other will be described.

This wire leaves the aileron lever and passes to the interior of the wing. After rounding a pulley the wire runs in a conduit of aluminium tube along the front spar of the cockpit. Here the wire is guided by more pulleys to the side of the cockpit at floor level and in line with the control columns.

The wire now passes to a pulley at the base of the column and then turns upwards to the drum. The wire passes round and is secured to this drum which in turn is fixed to the wheel. The wire turns down to the floor and crosses its upcoming self.

The down-going wire passes another pulley and turns along the interior of the rocking shaft and along to the next column where the process is repeated except that after reaching the floor again the wire passes up the side of the cockpit to the front spar and along it to the other aileron.

The rocking shaft on which the control columns are mounted serves no other function than to connect the two control columns and to act as a conduit for the aileron wires.

For operating the elevators the columns are connected by means of push-pull rods to a rocking shaft behind the dashboard. A mech-

AVRO TEN DETAILS.—From right to left above are shown typical Fokker wooden wing construction and the tail-plane adjusting gear. Below on the left is shown the skeleton of a wing engine-mounting and on the right one half of the dual controls in the pilot's cockpit.

AVRO TEN DETAILS.—On the left typical welded fuselage joints and on the right a sketch showing a part of the cabin framing, a ventilator and attachment of control fairleads.

fication from Fokker practice has been made here in the detail design of the push-pull rods which now have ball and socket joints with micrometer adjustment. The rocking shaft protrudes through the sides of the fuselage and has levers at each end which connect with wires to the elevators.

The rudder-bars are mounted on vertical spindles which are interconnected and have levers projecting through the sides of the fuselage which are coupled with wires to the rudder.

The wheel brakes are operated by means of a lever centrally placed between the pilots. This lever puts on both brakes. These are interconnected through the rudder bars with the result that movement of the rudder bars releases one wheel and increases the pressure on the other.

The tail-trimming gear is operated by means of a small handle over the pilot's head. A shaft runs back from the top of the bulkhead behind the pilot's cockpit, along the top of the fuselage to the front spar of the tail-plane. This shaft ends in a screw thread, which revolves in a nut in a lever attached to a rocking shaft set across the fuselage. This rocking shaft connects with the tail-plane spar through two levers and links.

The engine controls are set centrally in the cockpit, and those to the wing-engines pass to their respective engine through streamli conduits.

Behind the pilots is the main bulkhead to which the front spar attached. A ply-wood wall is behind this, with a door communicati to the passenger accommodation where there are seats for eight.

Windows run the length of the cabin and are openable. Over ea seat and in the side of the cabin are adjustable ventilators. Bagga racks run along the sides of the cabin. There is a door at the re of the cabin and behind this is the lavatory and the entrance door

The luggage compartment is further aft and has its own do on the opposite side of the fuselage to the entrance door.

THE AVRO FIVE.

The Avro Five has been designed by A. V. Roe & Co. as a scale down version of the Avro Ten. The Five has accommodation for pilot and four passengers. The power plant is three 105 h.p. Gen Major five-cylinder air-cooled radial engines. The pilot instead being under the leading edge of the wing is placed slightly in fro and has a completely enclosed cockpit with a glazed roof. The ta plane is rectangular in plan as compared with the swept-back ta plane of the Ten, and the tail-skid is of the leaf-spring type.

NEW AVRO AVIAN DETAILS.—On the left the adjustable tail-plane operating gear showing the [illegible] shaft which carries the rear spar of the tail-plane, and on the right the new cowling for the Gene[illegible] engine.

The Metal Avian.

The first Avian was the famous G-EBOV which created an excellent impression on its first appearance at Lympne during the Light Aeroplane Meeting of 1926. This same machine with modified wings and a Cirrus engine was flown by Mr. Bert Hinkler on his record-breaking flight to Australia.

Since that date Avians have appeared in ever-increasing quantities all over the World. The latest batch of metal Avians now going through the shops illustrates the latest Avian practice, and though not the final word in design for the type are extremely interesting as examples of all-metal light aircraft.

The most up-to-date Avians are those now being supplied to the South African and Estonian Air Forces. These machines are specially equipped for upside-down flying and have small special auxiliary tanks under the fuselage and Sutton Harness fitted as standard.

The wings are arranged as a single-bay biplane structure and fold about the rear spar. A jury strut is supplied for the purpose. The upper centre section is mounted above the fuselage on six struts, four vertical and two bracing the front spar forward to the fuselage. The upper centre section consists of the petrol tank.

The wings are wooden fabric-covered structures. The spars are of spruce spindled for lightness. The ribs are built up from spruce strips. The drag-struts are steel tube with plates welded to each end. These plates serve the dual purpose of wiring lugs and attachment plates to the spars. The wing root fittings are simple hinges on the rear spar and on the front spar the fittings are plates through which the locking pin passes.

The ailerons are balanced and are on the lower plane only.

The fuselage is of welded steel tube. The inter-bay bracing in the side panels is by diagonal tube struts and the transverse and horizontal bays are cross-braced with wire. The plywood decking is clipped in place and runs from the front cockpit to the tail. Behind the rear cockpit is a luggage locker of plywood let into the fuselage.

The tail unit is of the normal monoplane type. The tailplane is made of wood and covered with fabric and is generally similar in construction to the wings. The fin and rudder are welded frames covered with fabric.

The tail-plane is attached to the fuselage at three points. The front spar is hinged to the fuselage with two adjustable lugs and the rear spar is supported on a vertical shaft operated by the tail-raising gear and two struts running from the rear spar to the bottom of the vertical shaft. The tail-raising gear is used for normal adjustment and the front lugs are varied according to the type of engine fitted.

The undercarriage is of the divided type and consists of two Vees hinged on the centre line of the fuselage. The rear tube forms the axle and the front acts as a radius rod. The points of attachment on the fuselage are further strengthened with a distance tube running fore and aft between them.

The shock-absorber legs of the rubber-in-compression type slope upwards through the lower wing forward of the front spar and are attached to fittings at the base of the forward centre-section strut. The tail-skid is of the leaf spring type with hardened steel shoe.

The power plant for these particular Avians is the 105 h.p. Armstrong Siddeley Genet Major, but any of the alternative engines such as the Cirrus III. or Hermes may be fitted instead.

The fuel tank is carried on the centre-section, which consists of a square of steel tubes supported by the centre-section struts. The tank has a slot cut in it to fit over the front cross-tube and the back of the tank is supported by brackets on the rear cross-tube. The tank is made of welded aluminium. The auxiliary fuel-tank for upside-down flying is attached to the underside of the fuselage.

A modified form of N.A.C.A.-cum-Townend Ring cowling has been evolved for these machines and this has been found in practice to cool the engine adequately. The valve-gear is allowed [illegible] through the cowl, thus facilitating overhaul of the rocker-[illegible] Open[illegible] ings cut in the front permit the entry of cooling air, w[illegible] escape through annular slots at the back of the cowl. To contin[illegible] lines of the circular nose. In future machines the sides and b[illegible] the fuselage will be faired out to a more rounded section.

The seats are arranged in open cockpits in tandem. [illegible] seat bearers and the control-gear all form one unit which is [illegible] in a jig and assembled in completed form.

The rubber-bars have adjustable pedals, but the arrangement of the other controls is standard. By undoing four bolts in the front cockpit the control-unit may be removed and this will provide space enough for the fittings of an aerial camera.

An unusual provision for a machine of this class is a tail-trimming gear, to which reference has already been made. A small wheel on the left-hand side of the cockpit operates a sprocket and nut at the rear of the fuselage by lengths of chain and cable. The vertical spindle to which the tail-plane is attached is screwed and passes through the nut, the revolution of which thus moves the tailplane up or down.

A Matter of History.

Incidentally, the story of the evolution of the metal-fuselage Avian is well worth recording. The Avro Company announced to its agents abroad that it intended producing a metal version of the then all-wood Avian.

One agent immediately took the matter up with a Dominion Government, with the result that he obtained an order for a considerable number of machines with metal fuselages, for delivery in two months after the placing of the order. The company therefore had to design a metal fuselage, produce jigs, and build the machines in an extremely short space of time.

The fact that this was done within the time-limit not only does credit to the company, but also demonstrates the ease with which such welded steel fuselages can be built when once the designs and jigs are made.

These metal fuselages are put through in batches of fifty or so, and at the time of one's visit there was a stack of some thirty fuselages in the middle of the assembly shop ready for use.

A special version of the Avian which is being built to the order of Mr. C. T. Ulm is nearing completion. This machine has the new Genet Major cowling, and the fuselage is of a much fatter form than hitherto. This fatness is the result of fairing the fuselage to carry the lines of the nose aft, and the general effect is very pleasing. The centre-section tank has been removed and extra tanks stored in the front cockpit. This machine has the cross-axle Vee undercarriage in place of the standard divided type.

In the works there was quite a large number of 504 N training machines being built. This is the well-known Lynx-engined version of the veteran 504-K training machine. One large batch was being assembled for delivery to the Belgian Government in addition to a number bearing the R.A.F. markings.

Although the works were said to be not working at anything like full pressure, the shops were, to the unskilled eye, very busy.

THE LIGHT AEROPLANE AND THE FLYING CLUBS.

CONSUMPTION FIGURES.

Some interesting figures have been disclosed by the work the Cinque Ports Club during the past month. They ould be noted by other clubs.

The petrol-consumption figures for October show the most traordinary result in the case of G-EBPM. This aircraft used almost entirely for solo flying, and during the month e flew 39 hours 15 mins., and in addition the engine was n on the ground for 7 hours 20 mins, making a total of hours 45 mins. in the month, equivalent to a distance own of about 3,000 miles.

Throughout this period, the consumption averaged 3.647 llons per hour, roughly equivalent to 22 miles to the llon. The Ground Engineer deserves hearty congratulaons for obtaining these figures, which he says are the west he has ever heard of for the Cirrus Mark II engine. hey are all the more remarkable in view of the fact that e aircraft was in use as a hack machine for soloists roughout the period.

The other aircraft G-EBRI (which is used principally for ual instruction) averaged 4.306 gallons per hour throughut the month and achieved the very low oil consumption f .499 quarts per hour on Castrol XXL.

On Wednesday, the 6th, PM was given a very quick topverhaul and is now the fastest aircraft which this Club as yet owned.

Similar figures from other clubs would be valuable if ade public property.

THE DESOUTTER SPORTS COUPE.

The Desoutter Sports Coupé monoplane has very successully passed all its tests at Martlesham.

The figures show that the machine with a Cirrus-Hermes ngine climbs to 4,000 ft. in six minutes one second with a ull load of 1,800 lbs. and that it has a maximum speed of 11 m.p.h. at 1,500 ft.

The cruising speed is 96-98 m.p.h. at 1,900 r.p.m. and he company's figures show that the Sports Coupé with fuel anks, pilot and one passenger will climb the first 1,000 ft. n just over a minute.

The above figures are extremely creditable, coming as hey do from the most impartial source possible.

On Nov. 9 the Sports Coupé, flown by Mr. J. J. Flynn and carrying Mr. and Mrs. Desoutter and their small daughter, aged 8, flew from Croydon to Hanworth. It showed that it still had plenty of reserve power for climbing so that without luggage it should be possible for the machine to carry easily three persons and child.

At Hanworth it was flown by several pilots who all expressed themselves as very pleased with its performance, flying qualities and above all its non-stalling capabilities.

The production of the Sports Coupé is now in full swing at Croydon and the company will be delivering its first three machines to National Flying Services Ltd. this week. Thereafter the production will be at the rate of one every 10 days, which will probably be increased to one a week by the end of the year.

GIPSY MOTH SEAPLANES IN SARAWAK.

Two Gipsy Moth seaplanes were last year supplied to the Government of Sarawak for patrol and other duties. At the same time a pilot went out from England. He is now home on his first leave and from him comes the naturally expected statement that the seaplanes have given every satisfaction. One of them was unfortunately written off not long ago by being flown into some telegraph wires of which the pilot was unaware, and although there were two people in the machine nobody was hurt.

The Sarawak Government thought that Moth seaplanes would only be able to alight on large stretches of water and that, therefore, their usefulness would be limited. Soon after his arrival in Sarawak, however, the pilot found that the country abounds in disused and flooded mines. He alighted successfully on the first which he found and then proceeded to discover similar mines dotted over the country, nearly all of which are perfectly suitable for alighting and taking-off with a Gipsy Moth.

The Government were duly impressed with the unexpected handiness of the outfit. Reliability has been extremely good and repairs have been confined to a few odd details which, as the pilot remarked, was just as well, seeing that repair facilities were of the most primitive.

MOTHS FOR SOUTH AFRICA AND SPAIN.

On Nov. 9 three Gipsy Moths left Stag Lane for different parts of the world. Of these Mr. Roy Tuckett, a member of the Port Elizabeth Aero Club, South Africa, set out on his attempt to beat the record from London to Capetown. This is at present held by Mr. Murdoch in 13½ days, but Mr. Tuckett hopes to do the journey in 10 days.

His machine is standard except for stub exhaust-pipes and extra tanks. He carries 59 gallons of petrol, made up by the 19-gal. standard centre-section tank, a 20-gal. tank in the front cockpit and a 20-gal. tank in the rear luggage locker.

The other two Gipsy Moths were flown to Madrid by two officers of the Royal Spanish Air Force, Capt. Ricardo Garrido Verin and Capt. Infante Penax. These two Gipsy Moths are for training in the Spanish Air Force.

LONDON ASSURANCE.—A B.A.I.G. Formation. Gipsy Moths of the London Aeroplane Club, led by Capt. A. G. Lamplugh, with two other members of the British Aviation Insurance Group.—(*"Aeroplane" photograph.*)

FOR GLIDING ENTHUSIASTS.

There is an axiom in newspaper offices that for one person who writes a letter on any subject there are a hundred who intended to write the same letter and are either too busy or too lazy to do so. Consequently the fact that a dozen or so people should have written within a few days of the publication of the last issue of The Aeroplane expressing their interest in gliding seems to indicate that there is quite a large amount of interest in the subject.

Incidentally, Mr. Dieter Keller of Bournemouth points out that in Germany there are two different names for motorless flight. He says that if the motorless aeroplane or glider is only constructed for short flights, for gliding down a hill or a slope, the operation is then called gliding. But if the machine flies "on the wind," and if it flies higher than its starting point, that is called sailing, because the aeroplane flies on the wind and on the air currents like a sailing ship on the water. Mr. Keller is interested because in England he has only heard the expression gliding.

The point here rather is that if a motorless aeroplane is good enough to do anything like a respectable glide down a hill, then it is quite good enough to sit on an up-current if the contour of the ground and the strength of the wind happen to be right for the purpose.

There is no essential difference between gliding and sail-flying. Sail-flying is merely gliding down a current which goes up faster than the sinking speed of the glider.

On this point several people have wanted to know how Herr Kronfeld managed to reach a height of 2,000 metres, or roughly 6,500 feet, in a glider. According to one of the few people in this country who know something about gliding, he took off from one of the regular gliding places as a large cumulus cloud was coming over, and picked up the up-current which always exists under such clouds, and by it was sucked up to the cloud itself.

What happens apparently is that the air under a cumulus cloud is cold because it is in the shadow, and as the sun streams down past the edges of the cloud it heats the edges of that mass of cold air which promptly expands and rushes upwards. Thus there is a continual upward current made by the expansion of the cold air under the cloud.

If you have a good enough glider, and if you are a good enough pilot you can hook onto that up-current and ascend with it till you reach the cloud itself. People who only remember our humble efforts at Itford in 1922 will realise from this how far gliding has progressed in Germany.

Readers of this paper who can write and read German and are interested in gliding can get an immense amount of information on the subject by communicating with:—

Die Rhon-Rossitten-Gesellschaft E.V., Schubertstrasse 10, Frankfurt, a.M.

The publication in Germany which deals with gliding is the old flying paper, *Flugsport*, Bahnofsplatz 8, Frankfurt a.M. The Editor, Herr Oskar Usinus, is one of the leading authorities in Germany on this subject.

The following readers of The Aeroplane would like to get in touch with others who are interested in gliding:—

Mr. W. Grover, 170, The Grove, Wandsworth, S.W.
Mr. Richard G. J. Nash, Grand Hotel, Eastbourne.
Mr. W. E. Wroughton, 12, Lansdowne Gardens, East Croydon.
Mr. L. E. Williams, c/o Mrs. Peacock, 30, Sandow Terrace, Hayes, Middlesex.
Mr. Stephen Fry, Hamble, Hants.
Mr. I. B. Newbigging, Officers' Mess, R.A.F. Station, Eastchurch, Kent.
Mr. C. V. Kerpen, "Clouds," Finchfield Gardens, Wolverhampton.
Mr. D. E. Culver, c/o George Culver Ltd., White Lion Street, Pentonville, N.1.
Mr. J. P. Cecil-Wright, Royal Air Force College, Cranwell, Lincs.
Mr. L. S. Dawson, Nun-Appleton, Yorkshire.
Mr. C. P. Parker, Pinson and Boons Ltd., Dudley Road, Wolverhampton.
Mr. Dieter Keller, 17, St. Anthony's Road, Bournemouth.
Mr. H. S. Cameron, 45. Princes Street, Bayswater, W.2.
Mr. A. H. Martin, Lowfield House Lodge, Crawley, Sussex.

A great deal of information on the subject of gliding can be got by visiting the Science Museum, South Kensington. Mr. G. Tilghman Richards, who is on the staff of that establishment, has made a close study of recent developments in gliding and is constantly delivering lectures on the subject to visitors to the museum.

An important lecture on gliding is to be delivered by one of the leading German authorities to the Royal Aeronautical Society early next year, and this should centralise the interest in the subject.

Presumably the formation of an actual gliding club or gliding organisation in this country should be undertaken by the Royal Aero Club. But as that institution is so wrapped up in flying with motor-power, probably enthusiastic gliders would be wiser to form an association of their own, or to co-operate with the Royal Aeronautical Society.

THE ROUND EUROPE CONTEST.

The Commission Sportive de l'Aéro Club de France has homologated the results of the *Challenge de Tourisme Internationale* which was held over a European Circuit between Aug. 2 and Aug. 16, 1929.

The Challenge Trophy given by the Aéro Club de France has been awarded to M. Morzik, who piloted a B.F.W.-M.23 monoplane. The same pilot wins a prize of 100,000 francs from the Aéro Club, a Sèvres vase as the prize offered by the President of the French Republic, a Fiat A.S.1 monoplane, presented by the Italian Air Ministry, a medal presented by the German Aero Club, a D.K.W. motor-cycle, a trophy valued at 10,000 crowns presented by the City of Prague, a Gnôme-Rhône motor-cycle, a silver trophy presented by the City of Hamburg, and a prize presented by the Austrian Government.

Mr. Hubert Broad, flying a D.H. Gipsy-Moth, wins the second prize of 50,000 francs, a Fiat A.50 aero engine, and a gold medal presented by the Italian Air Ministry, a prize of 500 marks presented by the City of Breslau, a silver trophy presented by the City of Hamburg, a medal presented by the Belgian Aero Club, and a prize presented by the Austrian Ministry of Commerce.

Third prize of 25,000 francs is won by Lord Carbery, who flew a Raab-Katzenstein RK25 monoplane (Cirrus-Hermes engine). He also wins a Gnôme-Rhône motor-cycle, a pair of Sèvres vases presented by the City of Paris, a Bohemian crystal Trophy presented by the Czechoslovak Aero Club, a prize presented by the Polish Ministry of Communications, a bronze medal presented by the Belgian Aero Club, and a prize presented by the City of Vienna.

Miss Spooner, flying a D.H. Gipsy-Moth, wins the 10th prize of 7,350 francs and in addition receives a silk scarf presented by the Maison Rodier, and a silver trophy presented by the City of Hamburg.

Mr. Weedon, Mr. Broad's mechanic, receives a pair of binoculars presented by the well-known firm of Karl Zeiss.

The remainder of the prize list is too long to give in full but the above gives those of the most importance.

All of which merely shows the silliness of rules and regulations as drawn up by Committees and administered by them. The De Havilland firm got a splendid advertisement months ago out of the fine performances of Miss Spooner and Mr. Broad. And now nobody is interested in the technical results as disclosed above.

AN ACQUISITION TO THE TRADE.

For several months those on the inside of aviation have known that Henley's Ltd., of Devonshire House, Piccadilly, intended to go into the aircraft business on a big scale, but the information has been kept dark at the request of the firm, who did not want anything said about it in print till they were ready to make a full statement on their policy. As usual, some bright daily journalist has got hold of a story, and as usual The Aeroplane suffers for respecting confidences.

The facts are that Henley's Ltd., one of the most famous dealers in automobiles in London, intend to tackle the selling of aeroplanes to private owners on lines exactly like those on which they have run their successful car business. But, as the nation does not provide free testing grounds for aircraft as it provides free roads for cars, the firm has bought an aerodrome at Addington, on the hills above Croydon, which will act as a demonstration ground, as a garage and as a service depot.

Apparently the intention of the firm is to sell aeroplanes on hire-purchase terms, or to do deals on any terms which appear reasonable, such as delivering an aeroplane in exchange for an expensive car (though there can be few cars whose second-hand price would be that of a light aeroplane), or taking a car in part-payment, or on the other hand taking over a second-hand aeroplane in exchange for a new car. In fact, Henley's are prepared to consider any reasonable proposition.

COMMERCIAL AERONAUTICS.

IMPERIAL AIRWAYS INDIA SERVICE.

In the House of Commons on Nov. 6, in reply to a Question by Lt.-Cdr. Kenworthy, the Under-Secretary of State for Air said that the marine aircraft of Imperial Airways had suffered such severe damage during the recent period of abnormal gales in the Mediterranean that the Company had found it necessary to restrict the western part of the service, which was in any case primarily a mail service, passenger accommodation being strictly limited to mails and to accept no passenger for the present between Europe and Egypt. The Company had rearranged their fleet and were able to maintain the mail service by adopting temporarily a route via Cologne, Vienna, Budapest and Athens, instead of Genoa, Rome, etc. The usual passenger service was available between Egypt and India and the Company expected that the limited passenger accommodation over the through route would again be available next month.

THE CATERHAM DISASTER.

On Nov. 6 the D.903, a Junkers G.31 (three Junkers engines), crashed eight miles from Croydon in a wood on a hillside between Godstone and Caterham.

The machine belonged to the *Luft Hansa*, and was flying to Amsterdam, with four passengers and a crew of four.

Apparently the clouds were so low that the pilot decided to return to Croydon, and hit the tree-tops on his way back. The machine caught fire after crashing.

Only two persons managed to escape from the wreckage and resulting fire. One of these was Lt.-Cdr. Glen Kidston, R.N., and the other was Prince Eugen von Schaumberg-Lippe. The latter died of shock and burns on Nov. 7.

Prince Eugen, who was flying as assistant pilot, was not in the cockpit, but was inside with Lt.-Cdr. Kidston.

The inquest was opened at Caterham on Nov. 8 upon the bodies of the six victims, who were: Crew—Prince Eugen von Schaumberg-Lippe, Bruno Rodschinka, pilot (38), Wilhelm Ulrich, mechanic (36), Heinrich Niklas, wireless operator (31). Passengers—Mr. D. L. Jones, of Stockwell; Mr. Herbert John Gaspar, of Mincing-lane; Mr. J. T. G. Milne, a Calcutta merchant.

After evidence of identification had been taken, the inquest was adjourned until Nov. 22 so that Lt. Comm. Kidston might attend.

ANOTHER OPPORTUNITY.

Colonel E. Mossberg, who has for so many years been the Swedish Military Attaché in this country, and is known as a firm friend of British aviation, has recently gone to Sweden on a well-earned holiday. Before going he has left word that there is to be a great Exhibition of Arts and Crafts in Stockholm next September, and that there will be an International Aircraft Section in that Exhibition.

Everybody who went to the Gothenburg Exhibition two or three years ago had such a good time that one is sure that there will be a rush to exhibit British aircraft at Stockholm this year. Such an inducement is far stronger than is the mere prospect of doing good business through the winning of International Competitions, such as the Tour of Europe or the Zenith Cup.

THE LATEST JUNKERS.

On Nov. 6, at Dessau, the latest Junkers monoplane, the J.38, made its first flight.

This machine has a span of 107½ ft. with a length of 75½ ft. The wings at their juncture with the fuselage are nearly 8 ft. thick. This enormous thickness has allowed the engines and part of the passenger accommodation to be carried within the wing.

The J.38 weighs 13 tons empty and from 20-24 tons fully loaded. The range of the present machine is estimated at 2,000 miles with 3 tons of useful load. In test flights the machine made a speed of 124 m.p.h.

The four engines are so arranged that shafts project through the leading edge of the wing and drive tractor airscrews. There are two twelve-cylinder Vee and two six-cylinder in-line Junkers engines, the former of 800 and the latter of 400 h.p. Owing to their position in the wings the engines can be attended to while in the air.

A new form of flexible oil coupling has been devised by the Junkers company to provide the long drive necessary when the engines are placed so far from the airscrews.

The present petrol engines will be replaced later by Junkers compression-ignition engines, which will result in a further gain in economy and range.

This machine is a further step in the progress of Dr. Hugo Junkers towards his ideal of an all-wing aeroplane, a project which Dr. Junkers has been fostering since 1910.

A RECORD ATTEMPT.

On Oct. 18 Signor Maddalena and Signor Cecconi took off from the special concrete runway at Montecelio in the Savoia 64 monoplane (Fiat A.22T engine and variable pitch airscrew) in an attempt to beat the World's Record for distance and duration in a closed circuit.

The total load of the machine on taking off was 7,200 kgs. (15,850 lbs.) and it lifted after covering 1,500 m. (4,920 ft.) of the 1,700 m. (5,580 ft.) total length of runway. After flying for nine hours over the Montecelio—Torre—Flavia—Phare D'Anzio circuit the machine was forced to land with a broken water-pump.

INDESTRUCTO GLASS

With the possible future increase in the production of enclosed commercial aircraft, the demand for a transparent material for windows, etc., is a growing necessity.

The first essential in such material is its immunity from splintering and a secondary requirement, although not an essential one, is its resistance to discoloration or reduced transparency.

The British Indestructo Glass, Ltd., of Chase Estate, Park Royal Road, London, N.W.10, is putting on the market a product known as "Indestructo" glass which, although comparatively unknown in this country, is a material of long and honourable standing in the United States.

This glass is a laminated product made up of layers of polished plate glass and a flexible transparent binding material. The advantages claimed for this glass are that it is absolutely proof against separation, discoloration, and reduced transparency for indefinite periods of use. It can be drilled, ground and polished in exactly the same way as ordinary glass. It can also be etched, chipped or sand-blasted to produce ornamental surface patterns. Unlike many other makes of non-splintering glass, no sealing of the edges is required, and it can be cut by any workman with ordinary intelligence.

"Indestructo" glass fulfils the exacting requirement of the U.S. Army and Navy, and over 80 per cent. of all American service aircraft are fitted with "Indestructo" glass. One particular brand of this glass made to service requirements is bullet-proof.

Specimens of British "Indestructo" sheet and plate glass have been submitted for test by the National Physical Laboratory at Teddington, and copies of the reports on these successful tests can be had on application.

To these qualities must be added its power of insulation, its remarkable resistance to extremes of heat or cold, and freedom from condensation.

The danger of broken glass attending a bad landing are avoided as "Indestructo" will stand any strain of this kind. When, in the case of seaplanes, flotsam and jetsam are likely to cause damage, "Indestructo" glass is invaluable.

CROYDON NOTES.

Very deep sympathy is felt here by everyone for the ill luck which recently overtook the *Luft Hansa* machine. Lt.-Cdr. Glen Kidston, the sole survivor of the accident, seems to have rolled the dice with the Fates very successfully on this, as on many other occasions. When he arrived at Croydon Aerodrome that morning, he was booked to travel on the K.L.M. 10.30 machine, which for some reason or other, he thought started at 9.30. He therefore arranged a transfer to the earlier *Luft Hansa* machine, having, like everybody who knows both the K.L.M. and *Luft Hansa* lines, exactly the same confidence in each of them.

Commercial Aviation is going through an unfortunate period just at present, and so far as Croydon is concerned, this has not been helped by the somewhat eccentric behaviour of certain R.A.F. people. On Nov. 7, a couple of R.A.F. pilots, selecting Croydon as the place most worthy of their attentions, collided in the air and stepped out of their seats and parachuted quietly down. One landed in a certain waste space and the other in a tree in a cemetery.

A certain amount of annoyance was caused to Wallington people by the fact that one machine bored a hole in the roof of a house and poured all its petrol into the best bedroom, while the other set a house on fire and proceeded to broadcast live ammunition about the neighbourhood. Small boys, not yet tired of Guy Fawkes celebrations, enjoyed the bonfire and fireworks no end, but several gents who had heard the whine of bullets before, went home on all fours, and were accused, doubtless with injustice, of having had an extra one. An outstanding feature of the Press celebrations on this occasion, were photographs of Wallington firemen in brass hats examining the debris.

As a matter of fact, examining debris was about as far as the Wallington fire brigade got. Long before they arrived and indeed in an incredibly short number of minutes after the accident, Mr. Knight the Aerodrome fireman, was on the spot with his fire engine. He it was who put the fire out more or less single-handed, and the Wallington Fire Brigade arrived when he was packing his traps.

It was an extremely fine show on Mr. Knight's part, and the Aerodrome fire outfit is certainly to be congratulated.

Digitized by Google

Mr. Knight's superiors apparently do not deem him worthy of a shiny brass helmet and he has to function in a little round cap with no peak.

On the theory that brass hats are folk who turn up after the battle is over and argue with any survivors there may be, this is perhaps just as well, and if a brass hat were to slow down Mr. Knight's speed and efficiency, we hope he won't find one in his stocking this Yuletide.

The other joke to be recorded against the R.A.F. is that three of their aeroplanes mistook France for England and landed there accordingly on a recent occasion.

Being urged to go away and report to St. Inglevert, they attempted to do so, but one of them failed and all three had to stay where they were. Urgent orders then reached them to refrain from further demonstrations likely to excite the natives and it is now rumoured that the R.101 is to be sent to fetch them complete with several navigators, the Astronomer Royal and an expert on Bird Migration.—SPRY.

A CIRRUS APPOINTMENT.

Flg. Off. S. A. Thorn, late R.A.F., has joined the staff of Cirrus Aero Engines Ltd. as Test Pilot to fill the vacancy made when Mr. T. Neville Stack, A.F.C., left the company to join National Flying Services Ltd.

Mr. Thorn joined the R.A.F. on Sept. 21, 1925, and was posted to No. 5 F.T.S., Sealand, for flying training. On Aug. 17, 1926, he was posted to No. 17 (Fighter) Squadron and in 1927 joined the Royal Aircraft Establishment as experimental pilot. He remained there until he left to join Cirrus Aero Engines Ltd.

Mr. Thorn has been an enthusiastic member of the R.A.F. Aero Club and he has represented this Club at most of the Light Aeroplane Club Meetings during the past year.

FRENCH PENETRATION IN CANADA.

Fast Air Service Transport Ltd. of Montreal has imported six Potez 32 commercial cabin monoplanes (230 h.p. Salmson engine) and three more are *en route* to Canada from France. The company has also bought four Bernard monoplanes of the type used by MM. Assolant and Lefèvre in their flight from America to Spain.

The President of F.A.S.T. Ltd. is Mr. R. D. Lehan, a well-known Montreal financier, and the General Manager is Mr. L. J. Aupick.

Here we have the complete answer to the feeble argument that we cannot sell British aircraft in Canada because the United States are next door. If the French can sell aeroplanes in a British Dominion and we cannot, then the only explanation is that our manufacturers are asleep.—(read THE AEROPLANE any time for the past ten years).

THE PASSING OF CRICKLEWOOD AERODROME.

Handley Page Ltd. have opened their new aerodrome at Radlett, near Elstree, where for the future all flying will be done, though their works and offices will remain at Cricklewood.

Flying at Cricklewood has often been hindered by fog, especially during the winter. The firm hope that they have now overcome this difficulty, as the Radlett district should be pretty free from foggy weather.

Cricklewood closed as from Nov. 8.

TAIL-PIECE.

Just prior to the passage of the first flying-boat of the New York—Buenos Aires Line over Martinique, French West Indies, Mont Pelée erupted and enshrouded itself in cinders, steam, brimstone and, so far as distant observers may presume, treacle. Can this have been a gesture of shame or of rage?

PERSONAL NOTICES.

MARRIAGE.

SOUTHEY—DAVIES.—On Nov. 9, at Knightsbridge, H. F. G. Southey, Flg. Off., R.A.F., only son of the late the Rev. W. G. Southey and of the late Mrs. Southey, and Miss Joan Mary Gordon Davies, eldest daughter of Mr. and Mrs. H. G. Davies, of 27, Park Mansions, Knightsbridge.

BIRTH.

BEARDSWORTH.—On Oct. 27, at St. Catherine's Nursing Home, Letchworth, to Betty, wife of Flt. Lt. H. I. T. Beardsworth—a daughter.

Marconi Equipment for Air Ports

Quick and reliable communication with aircraft and other aerodromes is the keystone of efficiency for air ports and aerodromes. Marconi wireless telephone and telegraph transmitters are specially designed as ground stations for air services. These transmitters are built in various sizes and powers to meet the individual requirements of any air port and to provide the maximum efficiency in communication. Their design is based on world-wide experience in fulfilling the requirements of air services.

AIR MINISTRY.

Directorate of Technical Development.

A draughtsman, grade III, possessing the following qualications, is required at No. 1 Stores Depot, Royal Air Force, Kidbrooke, S.E.3:—Good experience as a mechanical draughtsman with sound knowledge of workshop practice. Capable of making working drawings from sketch design. Good theoretical training in strengths of materials and mechanics to do own stressing. Some electrical or coach body building experience an advantage. Salary up to 52s. a week plus Civil Service Bonus (which at present represents a total of 82s. a week) according to ability. Preference given, other things being equal, to ex-Service men. Applications should be made on a form to be obtained (quoting reference B.386) from the Secretary, Air Ministry (S.2), Adastral House, Kingsway, W.C.2, to whom it should be returned not later than Nov. 27, 1929.

PRACTICAL FLYING.

CINQUE PORTS flying club (Subsidised). WINTER RATES commence Oct. 1. 6 months' sub. 31s. 6d. Entrance fee 21s. Monthly sub. 21s. No entrance fee. Seven of our members took "A" licences in 4 weeks ending Sept. 26. Under 2 hours by car from London. Enlarged Club Room and Bar. Send 6d. to Hon. Sec., Hythe, Kent, for illustrated brochure. "LEARN AT LYMPNE."

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

Learn on latest types of Gipsy Moth, Hermes, Avian, and Gipsy Bluebird light aeroplanes. Chief Instructor, Captain V. H. Baker, M.C., A.F.C., Airwork Limited, Heston Air Park, Hayes 410.

National Flying Services Ltd. Tele., Ger. 9316. Join N.F.S. Learn to fly. Fly when you wish.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors. Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum of time. Write for particulars of recent successes. Special offer, trial lesson 12s. 6d. 45 minutes Paddington—Reading Aerodrome. 'Phone Sonning 114.

AEROPLANE PHOTOGRAPHS.

Copies of Aeroplane Photographs (indicated as such in the inscriptions under the pictures) may be had from:—THE AEROPLANE Office, 175, Piccadilly, London, W.1. Single prints, 6 in. × 8 in. cost 2s. 6d. each, and 1s. 6d. for each number of the same print. Larger sizes or larger quantities may be had at special prices.

SITUATIONS VACANT.

First-class Aeronautical Draughtsmen.—Five required immediately. London Ditsrict. Box No. 5739, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Vacancies occur from time to time in Australia for Mechanics holding at least three licences, also for skilled Aircraftmen with experience of metal constructions. Applicants who are prepared to reside in Australia should write, in the first instance, to the Staff Manager, Box 4539, G.P.O., Melbourne.

Aircraft Draughtsmen required immediately. Write, stating age, experience and salary required, to Handley Page Ltd., Cricklewood, N.W.2.

WANTED.

"All the World's Aircraft," for years 1914, 1924, 1926. Will pay good price. W. W. Constantine, 111, Grosvenor Road, S.W.1.

MISCELLANEOUS.

Petrolmotor Castings, partly machined, ½ horse (9s. 9d. per set). Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

FLYING CLOTHING.

No Connection with any other Firm.

S. LEWIS'S.—The Old Firm of Flying-Racing and Motor Clothing Fame, 19 and 27, Carburton Street, London, W.1. We wish our Thousands of Customers to know we have no connection with any other Firm. Flying Helmets, best Quality, Fur trimmed, 14s. 6d., 12s. 6d.; All Leather Lined Chamois, 10s. 6d., 12s. 6d.; Flat Type Phones, 5s.; Metallic Tubing and Rubber Connection, 2s. 6d.; Y Piece and Adapter combined, 3s. 3d.; White Flying Suits, 25s. 6d.; Ditto, with Lightning Fasteners, 35s.; White Combination Suits, 14s. 6d.; White Flying Helmet, 6s. 6d.; Featherweight type Goggles, fitted genuine Triplex Lenses, slightly tinted, new W.D., 7s.; Ditto, fitted genuine clear Triplex Lenses, 11s.; Aviation Mask Goggles, fitted genuine Tinted Triplex Lenses, 14s. 6d.; Ditto, fitted Tinted Triplex, 12s. 6d.; Meyrowitz Luxor Goggles, fitted Triplex unsplinterable lenses, 40s.; R.A.F. Scarf, 5s. 6d.; Pilot's Gauntlets, 12s. 6d. per pair; Suede Golf Jacket, best quality, ideal for flying, 50s. We are contractors to Foreign and Colonial Governments. S. Lewis's, 19 and 27, Carburton Street, London, W.1.

No Connection with any other Firm.

Wainwright's Flying Equipment.—Wainwright Flying Helmet (passed by A.M.) lined chamois, 22s. 6d. in Black or Tan, Fur trimmed helmets 12s. 6d., 15s. 6d. White helmets, pique or drill, 12s. 6d. Flat type earphones, complete with connections and "Y" pieces, 12s. 6d. Flying mask goggles, clear or anti-dazzle, 12s. 6d. Genuine R.A.F. Sidcots 57s. 6d. Chrome Leather flying coats, 84s. to £8 8s. Write for catalogue, Wainwright's, 300-302, Euston Road, London, N.W.1. 'Phone: Museum 6280.

Established over 30 years.

SITUATIONS WANTED.

Experienced "B" Licence Pilot is available in either temporary or permanent capacity for Air Taxi demonstration or similar work. Aged 28: Public School: 1,200 hours flying on all types, including twins, two-seaters, single seaters and seaplanes. Instructor at C.F.S. A.1. Category. Ground job of permanent nature with possible financial interest would be considered.—Write in first place to Box No. 5733, THE AEROPLANE, Cannon House, Pilgrim Street E.C.4.

Engineer, Pilot. Thirteen years' engineering and aviation experience. Sound knowledge design and construction aircraft. 1,100 hours' flying multi-engined machines (300 hours night), seeks post, administrative or flying. Home or abroad Box No. 5735, THE AEROPLANE, Cannon House, Pilgrim Street E.C.4.

Ground Engineer, A, B, C and D, seeks permanent position. Sound production and maintenance experience. Good references. Box No. 5737, THE AEROPLANE, Cannon House Pilgrim Street, E.C.4.

Pilot disengaged, B licence, wide experience in test, also in club instruction, would take position if only temporary. Reply to Box No. 5738, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Pilot, "B" Licence, 2,000 hours. C.F.S. course, taught over 100 pupils, just completed 170 hours' joy-riding this season. All references, etc. Apply Box No. 5730, THE AEROPLANE Cannon House, Pilgrim Street, E.C.4.

Works Manager, 12 years' experience as such on Large Flying-boats, Seaplanes and Aeroplanes, now disengaged seeks post as General or Works Manager. Thorough experience in Wood and All-Metal construction. Apply Box No 5732, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4

TUITION.

We offer sound Instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

INDIVIDUALITY.

Temperament.

Mass production methods are totally unsuitable to flying instruction. The *personal touch* in flight tuition is essential to bring out the INDIVIDUALITY of the pilot. Differing temperaments call for variations of method, and the instructor must be sufficiently EXPERIENCED to recognise various temperaments and treat them accordingly.

Personality.

It is at BROOKLANDS that you will find the PERSONAL TOUCH that develops individuality. The vast experience of the Brooklands instructors enables them to bring out PERSONALITY in flying. Specialised teaching can only be given by specialised teachers.

REMEMBER that the members of the Board of the Brooklands School are ALL fully qualified pilots, and that the instruction staff have been engaged in all forms of PRACTICAL aviation *continuously* for over fourteen years.

Brooklands School of Flying Limited,
Brooklands Aerodrome, BYFLEET, SURREY.

ON PATRIOTISM.

This is purely a personal matter, so I am going to deal with it as an individual and not as the more or less impersonal editorial One. I have been accused of being unpatriotic because I have given so much space in this paper to foreign aircraft, especially American aircraft. And so a justification of this policy seems necessary.

This policy is concerned with something greater than the immediate profits of the British Aircraft Industry, for, as Mr. Churchill said years ago, our Air Power depends on our Air Force being based on a strong and firmly established Aircraft Industry. And no industry can be firmly established unless its own policy is far-sighted.

As Editor of THE AEROPLANE I have steadily pointed the way towards commercial prosperity, so that our Aircraft Industry may become financially solid without having to depend entirely on being spoon-fed by our Air Ministry. And I have argued that the way to put the Aircraft Industry on a sound financial basis is to make and sell commercial aircraft at a profit.

Obviously, to make commercial aircraft at a profit we must make aircraft of sorts which can be sold in whatever market exists. And, except for two types of light aeroplanes, we have not sold commercial aircraft in big enough quantities to be worth considering.

In support of these arguments I have constantly told our aircraft constructors what the American Aircraft Industry is making, and why American aeroplanes are being sold in such vast quantities, not only in the United States, but in Canada. And I have published specifications and illustrations of those American aircraft so that our designers, senior and junior, may see what they are up against.

Consequently I have been accused of boosting American aircraft to the disadvantage of British aircraft. I have been told that THE AEROPLANE lives on the advertisements of British aircraft firms (which is perfectly true), and that therefore in admitting that anything good can come out of America I am not only being unpatriotic, but that I am biting the hand that feeds me.

Presumably to be patriotic in the eyes of such critics THE AEROPLANE ought to consist entirely of eulogies of British aeroplanes and engines, whether good, bad or indifferent, and of hostile criticism of all American, German, French and Italian aeroplanes and engines. According to this idea we ought never to illustrate any new and improved American or European aircraft or engines, because that would be giving them free advertisement.

And what would be the result of such a policy? It would simply be that for a little while our old-fashioned designers would grow mentally fat and apathetic,—till they began to starve for lack of business,—and our younger and more active designers would have to go without that knowledge of developments in other countries which is at once their spur to improve their own work, and their source of inspiration with new ideas.

Therefore I hold that telling our people what American machines can do, and showing our Trade people what American machines look like, and telling them frankly that they have got to beat those performances and designs if they are going to make their livings, let alone make their fortunes, is far more patriotic than merely building up for them sand-castles in Spain in which they can bury their silly heads like ostriches.

**"THE GATES ARE MINE TO OPEN,
AS THE GATES ARE MINE TO CLOSE."**

(KIPLING - *Our Lady of the Snows.*)

CANADA'S CHOICE.—Air Transport firms in the British Dominions buy what they like, not what we here think they ought to like. Hence this Fairchild Monoplane of the FC-2W type (400 h.p. Pratt and Whitney Wasp engine). It carries 160 gallons of gasoline, 10 gallons of oil, and a pilot (say 180 lbs.). And after that it has a pay-load of 1,230 lbs. on floats or 1,500 lbs. on wheels.—These figures are not from the makers' catalogue but from the Canadian users. If there is a British aeroplane to beat it, then Canada will buy from us. But Canada's patriotism does not run to buying what Canada does not want. This machine belongs to Inter-Provincial Airways Ltd. of Grand 'Mere, Quebec.

The Essential Englishman.

The Englishman is by nature lazy,—or rather he has an immense mental inertia which makes his mind slow to move. But there is always hope for a lazy man, because if you can once start him working he is too lazy to stop. And that is the salvation of the essential Englishman.

Tell an Englishman that his work is good and he will stop working to admire it. Or at any rate he will make no effort to improve it. But tell him that he is a fool and that his work is rotten, and he will turn out the best work in the World, just to prove that you are a liar.

Give an Englishman a perfect workshop and perfect machine-tools and he will sit with his hands in his pockets watching the tools do the work. But put him in a pokey little factory with nothing but hand-tools and he will turn out work far finer than any machine-tool ever made.—Only unfortunately it does not pay.

In theory I have always been a protectionist, in favour of a tariff-wall which would keep out all foreign goods. In practice I am a full-out free-trader because I know that if you once build a tariff-wall the English manufacturer will go to sleep in its shadow, as soon as he finds himself out of the heat of foreign competition—with the result that the consumer will have to pay through the nose for old-fashioned and inferior goods.

Consequently the only hope for the prosperity of this nation is free competition,—and the fiercer the better. When the British Manufacturer and the British Workman together have to use their wits, and work or starve, they produce the finest goods in the World.

To save them from starving more than is necessary the kindest thing to do for them is to tell them as often and as rudely as possible just what-like is the competition they have to meet. And at the moment the British Aircraft Industry is up against American Competition.

That is why I keep on acclaiming American progress. And, because he hates being waked out of his self-complacency, the British manufacturer and designer says that I am unpatriotic. At any rate I am in good company, for some six years ago Mr. C. R. Fairey imported American fuselage designs and engines, which have since been copied by every successful designer of aircraft of those types. And last year Mr. J. D. Siddeley imported the designs of the best commercial aircraft from the Netherlands. They also will, in due course, be copied,—just about when they are becoming out-of-date.

The Essential American.

To understand what American competition means and meet it you must understand something about what American competition has done in the past. And you must also know something about the American temperament.

In preparation for War the Staff studies the psychology and the history of every possible enemy and ally in the most minute detail, so as to know how to meet the attacks of the one and how to use the qualities of the other. The same study pays in Commercial War.—and, though the Americans are our friends and nearest relatives, commercially we are at war with them, and will be so till they have bought up all our industries.

The first thing to understand about America is that there is no such thing as an American. All the people who matter in America are of the same breed as ourselves. They are either English or Scots or Netherlanders or Germans or Scandinavians. Also there are some of the better sort of Irish, apart from a lot of the worse sort of Irish. The Nordics run the United States,—and the other Europeans, under the comprehensive American names of Wops, Dagoes, and Bohunks, do the work for them.

But you must also remember that, as I have often said before, everybody in America is descended from people who have had the energy and the initiative, and enough of the gambling instinct, to pull themselves up by the roots out of Europe and back their own ability on the other side of the Atlantic. Thus, on the principle that birds of a feather flock together, although there is no such thing as an American, and never can be, there are in the United States several millions of people belonging to one nation all of whom have the same qualities of energy and initiative, plus the willingness to take a chance. And those qualities are all to a greater or less extent lacking in those of us who have stayed at home.

Corroborative Evidence.

Now then,—if you do not believe my estimate of the American character, read what one of the greatest writers in the English language learned about the American engineers fifty years ago. He says:—

You must not suppose, because I am a man of letters, that I never tried to earn an honest living. I began trying to commit that sin against my nature when I was fifteen, and persevered, from youthful timidity and diffidence, until I was twenty-three.

My last attempt was in 1879, when a company was formed in London to exploit an ingenious invention by Mr. Thomas Alva Edison—a much too ingenious invention as it proved, being nothing less than a telephone of such stentorian efficiency that it bellowed your most private communications all over the house instead of whispering them with some sort of discretion. This was not what the British stockbroker wanted; so the company was soon merged in the National Telephone Company, after making a place for itself in the history of literature, quite unintentionally, by providing me with a job.

Whilst the Edison Telephone Company lasted, it crowded the basement of a huge pile of offices in Queen Victoria Street with American artificers. These deluded and romantic men gave me a glimpse of the skilled proletariat of the United States. They sang obsolete sentimental songs with genuine emotion; and their language was frightful even to an Irishman. They worked with a ferocious energy which was out of all proportion to the actual result achieved.

Indomitably resolved to assert their republican manhood by taking no orders from a tall-hatted Englishman whose stiff politeness covered his conviction that they were, relatively to himself, inferior and common persons, they insisted on being slave-driven with genuine American oaths by a genuine free and equal American foreman.

They utterly despised the artfully slow British workman who did as little for his wages as he possibly could; never hurried himself; and had a deep reverence for anyone whose pocket could be tapped by respectful behaviour. Need I add that they were contemptuously wondered at by this same British workman as a parcel of outlandish adult boys, who sweated themselves for their employer's benefit instead of looking after their own interests?

They adored Mr. Edison as the greatest man of all time in every possible department of science, art, and philosophy, and execrated Mr. Graham Bell, the inventor of the rival

A LIGHT CABIN MONOPLANE.—The Cessna AW. four-seat cantilever monoplane (110 h.p. Warner Scarab engine). **And we need about 40 h.p. per passenger for a lower performance,—but with greater strength.**

An Epic Story!

"THE RESCUES FROM KABUL

IT is impossible to read without a thrill the story told in the official report of the rescues from Kabul carried out by the Royal Air Force in December, January and February last.

In those winter weeks—destined surely to be famous for ever in the history of the Air Force—the great aeroplanes went to and fro, to and fro, in all weathers over mountainous country of the most forbidding kind, where landing was practically impossible and any sort of failure in skill or in material must have meant disaster. There was no disaster. In more than seventy journeys nearly 600 men, women and children were rescued, and not one suffered injury.

Henceforth it will not be difficult to connect the ideas of precision, punctuality, efficiency under the most exacting conditions, with transport through the element which hitherto men have regarded as more chancy than land or even sea. It is a great thing to have won the Schneider Trophy.

It is a greater thing, greater for the country and greater for the future of travel by air, to have effected the rescues from Kabul.

Not then for the first time, but then for the first time in that new and marvellous manner, and with a swiftness denied to both the older Services, neither of which could have sent help from Iraq to India in two days, those forces came to the rescue of men, women and children in peril; and no less than a great victory in battle, this triumph deserves to be emblazoned on the colours."

The Times, 8 *Oct.*, 1929.

VICKERS aircraft combined with NAPIER engines made these rescues possible.

telephone, as his Satanic adversary; but each of them had (or pretended to have) on the brink of completion, an improvement on the telephone, usually a new transmitter.

They were free-souled creatures, excellent company: sensitive, cheerful, and profane; liars, braggarts, and hustlers; with an air of making slow old England hum which never left them even when, as often happened, they were wrestling with difficulties of their own making, or struggling in no-thoroughfares from which they had to be retrieved like strayed sheep by Englishmen without imagination enough to go wrong.

The Witness.

That was written by Mr. Bernard Shaw in his Preface to the American edition of *The Irrational Knot* in 1905. The book itself was written in 1880.

That description of the essential American—and of the essential Englishman—will never be bettered, and for several thousands of years there will probably never be any need to revise it. Any student of psychology who reads that description will understand how, and why, the Americans get ahead of us, and why we win out in the end.

But do not forget that America made millions out of selling telephones, and other things made by the Edison-Bell combine, which we might have made ourselves if our electrical people had not been so slow.

The great historical fact is that the fool Englishman without imagination enough to go wrong muddles through somehow and comes out on top at the finish. But, as was shown by our method, or rather lack of method, in winning the War 1914-18, coming out on top always costs us fifty times as much as it might cost us if only we would use a little sense, and if only we would learn from the experience of others instead of refusing to learn except from our own bitter experience.

One of our commonest faults is that of despising our enemies, or our competitors. Personally I have had some 35 years of experience of American competition and possibly a brief review of that competition may be useful to the younger members of the Aircraft Industry even if the older ones, few of whom have had 35 years' experience of business, think that they already know too much to profit by it.

The Teaching of Experience.

When I was a youngster and was supposed to be learning engineering in London, long before there were any motor-cars, I used to be able to push a bicycle rather fast, as did the late Charles Rolls who afterwards founded the Rolls-Royce firm and S. F. Edge and some others who afterwards became well known. And wonderful stories used to come from America about the speeds done in American bicycle-races.

We used to think that somewhere about 32 seconds for an un-paced quarter-mile on the track was amazingly good going. The Americans claimed to have done 28 seconds. We, being English, laughed at their performance-figures, and said that they timed their races on an oil-can to imitate a stop-watch. We were just like our aircraft manufacturers, who laughed at American performance-figures till the Curtiss seaplanes came to Cowes and took the Schneider Trophy away with them.

A. A. Zimmerman came over in, I think it was, 1893, and proceeded to give all our scratch-men about 80 yards in the mile and a licking. We merely said that he was a human phenomenon and let it go at that. The next year Walter Sanger came over, and, although our people had learned something about thoroughness in training from Zimmerman, he proceeded to beat them worse than ever.

He rode an absurd-looking bicycle with wooden rims which was pounds lighter than anything we ever built. And our cycle manufacturers said that it could not hold together just as our aircraft manufacturers say that American aircraft cannot hold together. But it did.

Then we began to believe the American performance figures and we began to take our training seriously. And years afterwards our men proceeded to beat American figures.

What the Cycle Trade Learned.

In 1895 I went to Coventry as a draughtsman in a big cycle firm, and I was about the worst draughtsman that ever happened. But having seen American bicycles, and having seen the bicycles which small firms in London, who had learned their lesson, were turning out on somewhat similar lines, I was tactless enough to sketch out roughly what Coventry bicycles ought to look like, and to say that probably Coventry would be making those bicycles two years later.

After about eighteen months I was sacked because the firm said that they could not do with two managing directors. But the bicycles which the firm made for the next season but one were very like those American bicycles. And twenty years later the man who had sacked me came and asked me whether I could help him to find a job.

In those days the cheapest bicycle made in Coventry sold for about 12 guineas, and we thought that it was an absurdly low price. American bicycles were being sold all over the World for about 50 dollars, and later for 40 dollars.

Then, much to the disgust of Coventry, a Birmingham man named Ivy Rogers took an old warehouse in Coventry, and, instead of trying to make everything himself, he had all his parts made under contract by comparatively small firms in the Birmingham district at cut prices, by the simple process of telling the makers that he would pay so much and no more and that if they did not like to make the stuff at that price, somebody else would. The result was that he put on the market Coventry-built bicycles at £7 apiece.

Then the Coventry manufacturers were forced to sit up and take notice. Within a few years they had re-designed their machines for cheap production, they had bought modern American machinery, they had cut their prices down, and they were getting back the World's markets from the American manufacturers and were making handsome profits.

The Motor Trade's Experience.

Almost precisely that same sequence of events has happened in the Motor Trade, but the course of History has been varied by conditions. Coventry and Birmingham began making motor-cars on German and French models. In fact, the Daimler Company of Coventry was an offshoot of the Canstatt-Daimler firm in Germany which made the Mercédés car. And Louis Coatalen came from France to design the Humber. American cars were, of course, regarded with scorn. And the published performance-figures of American cars were frankly described as lies.

We made cars which suited our roads and the European roads, which were pretty good roads. The Americans made cars which were designed to go without any roads. And the natural result was that the Americans got the whole of the market in the British Dominions as well as in all foreign countries outside of Europe.

Our cars were much more beautifully made and on our roads they wore rather longer than the American cars did. But on what passed for roads overseas our cars either broke or simply did not go because their tracks were too narrow and they were too low on the ground, and their engines burnt themselves up.

Also, the Americans turned out cars which were fully equipped with everything that you could want on a car. We charged extra for such essential things as lamps and hoods and speedometers. The Americans provided detachable wheels and spare wheels, while we were still content with fixed wheels, and made do, when tyres burst or punctured, with Stepney wheels which clamped awkwardly onto the sides of rims.

And the worst of it was that these despised American cars which their manufacturers only intended to be used for a year or so and then thrown away, kept on running in the British Dominions for several years.

Then the British Government started taxing cars on cylinder-capacity. And the British manufacturer, trying to be clever, invented the small-bore high-speed engine to cheat the tax-collector. The result has been that for ten years we have been driving horrible little high-speed engines which wear themselves out in a few thousand miles and cost more in repairs than a big engine would pay in taxation and extra petrol-consumption.

Our makers advertise that their small engines do 4,000 miles to the gallon of oil. So they do—on the first gallon. But they do 1,000 miles on the second gallon, and about 500 on the third gallon, and something under 100 on the fourth, because of wear on the pistons.

Meantime the Americans have gone on steadily with their fat woolly engines which wear indefinitely and put up a performance. The result has been that at the last Olympia Aero Show the great step forward for the year in the 1930 models, if you please, was the introduction of bigger engines, which will wear better, and the equipping of the cars themselves, as a great attraction to the British public, with all the gadgets and little comforts and luxuries which have been standard fittings on every American car for the past five or ten years.

Whether any of the motor papers have had the gumption or the pluck during the past ten years to tell the British motor manufacturer the particular kind of fool he has been I do not pretend to know. British Aviation has been struggling too hard during that period for me to have time to look at motor papers. But quite by chance a week or two before the Olympia Show I happened to come across an article by one John Prioleau, who seems to write more sense than most people on the subject of motor cars, in which he stated in some detail what he hoped to see at Olympia. And all the things that he hoped to see made up a very good specification for any standard American automobile of five or six years ago—in fact, just the kind of American car that many of our patriotic manufacturers of British aircraft have been driving for quite a while.

Now we read in the papers of a great selling campaign for British cars in the British Dominions. Which means that as there are well-made English cars on American lines to sell overseas there is some hope of selling them. And the campaign ought to be a success. At any rate, I hope cordially that it will be.

But there is no reason why we should be starting such a campaign in 1929. The English automobile manufacturer ought to have made cars on those lines in 1919, and he ought to have got the trade in the British Dominions ten years ago.

The Big Idea.

Precisely with the idea of saving the British Aircraft Industry from ten years of depression, and with the idea of getting the overseas trade in aircraft before the Americans get it, The Aeroplane has been rubbing in descriptions of the kind of aircraft which are doing trade in the United States at present, because they are the kind of aeroplanes which are most suited for use in our Overseas Dominions and in all other countries overseas.

Also these American aircraft have the additional advantage that they are precisely the types of aeroplanes which are suitable for use *in* the British Isles,—and for air transport out of the British Isles all over the World. For the great difference between the Aircraft Trade and the Automobile Trade is that whereas European cars were originally produced to run on European roads, and American cars were designed to run without any roads, the air happens to be very nearly the same all over the World, and consequently the aeroplane which is suitable for one country is equally suitable for any other country,—with perhaps minor alterations in the accommodation.

More Evidence.

If anybody has any doubts about the performances and the general high qualities of American aircraft, I advise them to have a talk with Mr. W. L. Hope of Air Taxis Ltd. Lawrence Hope was one of our earliest air-transport pilots. He flew Handley Pages when Handley Page Transport Ltd. started up as early as might be after the Armistice. He has won the King's Cup Race twice in a Moth, so he is no mean judge of the qualities of an aeroplane, whether big or small. And for the past year or two he has been operating a Fokker monoplane for his air taxi work because no British aeroplane exists which will do the same job.

He has just come back from the States, and while he was there he flew twenty-seven different types of American aeroplanes. Most of them were cabin ships of the type which is universal everywhere except in this country, that is to say of the type of the Fokker and the Ryan and the Bellanca and the Fairchild and the Stinson and dozens of others. He has also flown some of their bigger multi-engined ships and some of their small open craft.

His opinion of American aircraft seems to be something like the British workman's opinion of beer,—none of it is bad but some of it is better than others. He says that their performance-figures are all that they claim for them, and that they are beautiful to handle.

They all have wheel-brakes and they all have swivelling tail-wheels, and their internal equipment is magnificent. You can go and buy those machines practically off hooks in the American factories. But you cannot buy a machine of that type in England if you want to. And unfortunately it happens to be the type that is wanted in the British Dominions and all over the World, and it will soon be wanted in this country.

Personally if I were starting to build aircraft myself tomorrow I should not build that type, I should build something quite different, which I believe would be very much better in that it would have all the qualities of that type plus much higher efficiency. But in the meantime that is the type which can be sold. And it is a type which can be built cheaply and quickly.

Where We Have Scored.

Up to the present moment the British Aircraft Industry has been in a position to compete on equal terms in the Overseas markets with American firms. And so far as mili-

tary aircraft are concerned we have beaten the American manufacturers.

Quite definitely, any of our military aircraft are better built and better equipped than are any but a few American military aircraft. We have had more experience of the use of aircraft in war than have the Americans, and that counts for something with the fighting services of foreign nations.

Also, on the whole, foreign nations, especially in Latin America, rather prefer English business methods. Which is possibly because they have had so much experience of the get-rich-quick type of American business man and mistrust all American methods accordingly, whereas they have not come across the objectionable type of English business man, who is just as much a twister though in a different way, and happily has not so far appeared to any marked extent in the Aircraft Industry.

At any rate, quite considerable sums have been spent on British military aircraft by foreign nations, and those aircraft which have been bought are beyond argument the finest products of the World in their class. But I do wish that the British Aircraft manufacturer would remember that within a very few years the sale of military aircraft is going to be a very small fraction of the total sales of aircraft all over the world.

Of course if any individual firm has no ambition other than to maintain its present type and to go on selling a dozen machines here and a dozen machines there to the fighting Services of foreign powers, well and good. That is the private business of that particular firm. I am not writing for people of that sort. I am writing for the Aircraft Industry as a whole, into which little new firms are coming who if they are properly run and if they are able to deliver the goods, will soon have between them very much bigger export business than the combined exports of all the war machines.

Past Conditions.

Hitherto, as I have said, the conditions under which the American Aircraft Trade and the British Aircraft Trade have had to compete with one another have been pretty well the same. They have had to design their machines for the same air. And they have had to produce them under very similar conditions.

Although the output of American aircraft is so enormous compared with ours, there are so many different American firms that there has not as yet been anything like mass production. The free and independent American workman is much more slave-driven, as Mr. Bernard Shaw has said, than is the English workman, so probably his individual output is higher. But on the other hand, he is paid much higher wages, so probably the labour on American machines costs as much as ours does. Where the American manufacturer has scored mostly has been because he has not been put to so much expense for the sake of the Government Certificate of air-worthiness, and he has designed the details of his aeroplanes for cheaper methods of construction.

Still, on the whole there has not been much in it between the price of an airplane and the price of an aeroplane. But, where the American has scored, is that he has been able to supply the type of aircraft that people want.

The result has been that Canada is flooded with American machines, and with American-Dutch machines in the shape of the American-built Fokkers. And American machines are already getting into Australia and South Africa. Only the other day an American-built Fokker was supplied to Union Airways of South Africa, a firm which is subsidised by the South African Government and began operations with a number of Moths.

Of course there is the argument that Canada is next door to the United States and that naturally Canadians buy American aircraft because they can be flown from the factory to the user and can easily be sent back for overhaul. But that does not account for the fact that two or three weeks ago half a dozen cabin monoplanes built by the Farman Company in Paris were delivered to a firm in Canada, and that if that firm had wanted to buy cabin monoplanes of that type in England,—like the Duchess of Bedford and Mr. C. D. Barnard,—they could not have got them, because the type does not exist in this country, although it is the type that everybody wants all over the world.

Changed Conditions and Wall Street.

So much for what has been happening under past conditions. But let us consider what is likely to happen under the different conditions which now threaten us.

America has just had one of the most awful financial slumps in her history. The result has been that hundreds of thousands, if not millions, of individual small investors have either gone broke or at any rate are very much worse off than they would have been if American finance had remained normal. The United States are the home of the hire-purchase business, and the vast majority of the people in the States are in debt up to their necks on hire-purchase payments for all their household goods.

This big slump in Wall Street must affect the whole fabric of society in the States. It means that all the little investors will fail to keep up payments on their motor-cars and wireless-sets and vacuum-cleaners and other comforts of the home which they have bought on the Kathleen Mavourneen principle of "it may be for years and it may be for ever."

This means that the firms which do hire-purchase business will fail, and the manufacturers who supply them will make bad debts and will not get fresh orders. Which means that the men in the factories will be out of work, and that the banks which have financed the manufacturers and the hire-purchase people will burst, and so "a bad time will be had by all," to paraphrase a popular American expression. For which I am very sorry, because I have an immense number of very good friends in the States. I only hope most heartily that none of them will be badly hit.

The Pendulum of Prosperity.

The pendulum of prosperity swings across the Atlantic on a period of somewhere between seven and ten years. Our last boom was the false boom which followed the War in 1919. America has been booming ever since.

Our slump came quite suddenly in 1920 and reached its worst in 1921. Then we ran along a flat of hard times until about 1926, and since then we have been slowly crawling upwards. So, as has been said in this paper several times in the last two years, we are coming up towards a general boom in prosperity.

But that does not mean necessarily the sort of boom which we want in the Aircraft Industry,—in fact it may be just what we do *not* want. There may be a sudden rush next year and for the next two or three years for aeroplanes for private owners and for taxi work at home. But that is not going to put the Aircraft Industry on a sound basis if it makes us neglect the Overseas markets. It may provide people with quick profits but it is not going to build up solid businesses.

In those early days of the cycle trade, of which I have told, when there was a boom in this country I remember seeing my managing-director going round taking the labels off hundreds of machines which had actually been packed for export, and having them replaced with labels for agents in the British Isles. Which simply meant that we were saturating our home market quickly and were starving our

Overseas market. The result was that the Americans just walked into it with their low-priced machines. That is one of the things we must avoid when the aircraft boom comes in the next couple of years.

A Warning.

The more serious feature of the present situation is the effect on our Overseas markets of the slump in the United States. Although the American consumer may go broke and so ruin the home market for aeroplanes, the important American aircraft and engine firms are very strong financially.

The people who put money into them may not see it back for some time, and the mutts who bought American aircraft shares at twenty or thirty or fifty times their real value will never see their money back. But the general conditions are quite different from what they were when the slump came in the American bicycle trade and motor-car trades.

The American aircraft firms still have their capital and they still have the equipment of their factories, and they have money enough to buy more equipment for their factories. So they will go on making aircraft and engines rather than shut down because of the slump at home. I say this on the authority of the most recent information from the States.

What that all means is that as the output of these factories cannot be absorbed in the United States it will be dumped on the British Dominoins right now, whereas if things had remained normal in the States the home market would not have been saturated for another three or four years, and we should have had time in those four or five years to produce in this country, if we had the intelligence, aircraft of the types wanted in our Overseas Dominions.

We should then have got a strong footing in those dominions before American over-production started the dumping campaign which would necessarily have followed.

A Comfortable Delusion.

There is no use in our aircraft manufacturers deluding themselves with the idea that we can afford to let American aircraft be dumped in our Overseas Dominions because when the buyers get the American stuff they will be disgusted with it and will be glad to buy our better aircraft when we start delivering. That is the old argument with which we used to humbug ourselves in the days of the cycle trade and the motor trade. If we try to humbug ourselves in the same way to-day we shall merely ruin ourselves when we might be making a fortune.

American aircraft of to-day are not to be despised. The old and crude American methods of manufacture have been scrapped. The American Air-Worthiness Certificate issued by the Department of Commerce is recognised in Canada and in Australia, and an American machine with a Canadian air-worthiness certificate will be recognised in any of the other British Dominions, or in any other country in the world.

American performance figures are just as trustworthy as anybody else's performance figures. And the British aircraft manufacturer who scoffs at those figures is just as foolish as we were in my young days when we scoffed at American bicycle records and at the performances claimed for American motor-cars.

American methods of production of raw material and parts, are ahead of ours. American foundries, and American metallurgical works in general, such as those firms which produce stampings and forgings and so-forth, are miles ahead in their methods and in their machinery of our old-fashioned conservative firms in Birmingham and Sheffield. And so material and parts are as good as ours and cheaper.

Mass Psychology.

Presumably I shall be called unpatriotic for making these statements also. Perhaps I might put all this into a kind of circular letter to the individual heads of the twenty firms or so who constitute officially the whole British Aircraft Industry. If I did I might get polite letters thanking me for telling them what they already know,—or ought to know, if they don't. And there the matter might end. But that information might never reach the men who matter most,—namely, the younger men who must in the end save the British Aircraft Industry if it is ever going to be saved.

The patriotic course, as I conceive it, is to tell everybody in the British Aircraft Industry, and everybody who is interested in aviation not only in this country but all over the British Dominions and all over the world just exactly what the position really is.

Mass psychology is a curious thing. A small group of individuals may have certain knowledge for years and years and keep it to themselves. They may even do their best to let other people share their knowledge. But nothing happens till enough people get to know about it to create a psychological mass momentum. And then things happen suddenly. This is simply an effort to hurry up the happening of something which will make the British Aircraft Industry a great paying commercial affair.

If the close corporation of aircraft firms which at present exists does not take the present situation seriously and go out for the commercial markets Overseas, then either of two things may happen. Either the enterprising and hard-pressed Americans will get that market, or else some of the dozen or so young and energetic firms who are at present outside the sacred circle, and in a very small way of business, will produce what the market wants.

Then they will get hold of some of the immense amount of money which is floating around the city of London at the present moment waiting to be put into real live aircraft concerns. And those young firms will suddenly jump ahead just as young and energetic firms have jumped ahead in the motor-trade and in every other trade.

Ten years ago nobody outside of the good city of Oxford had ever heard of the Morris car and now look at them. Think of all the stupid old motor firms whose managing directors might have been where Sir William Morris is if only they had had the energy and intelligence and had not been so self-satisfied.

To-day anybody overseas who ever thinks of British motor-cars at all thinks of the Rolls-Royce as the World's finest luxury car, and perhaps of the Bentley as the best sports car for those who can afford it. And apart from them the Morris is looked upon as the Only British Automobile. Most of the rest are definitely so ugly that they come under the generic heading of what a friend of mine calls the "Epstein Straight Four." But the overseas buyer knows dozens of makes of American cars which stand up to the work needed in his country. And all these cars might have

been British if the British car-monger had not been such an obstinate fool, and if he had made what the market wanted instead of what he thought it ought to want.

So all this is written to try to prevent our Aircraft Trade from following in the way of our Automobile Trade. Is that or is it not patriotic?

History Repeats Itself.

There is one peculiar fact in the history of most manufactured articles, especially in engineering, which have been produced since the United States became a nation of manufacturers. Such things have nearly all been first invented in England. They have been turned down by our scientists or experts or manufacturers or shopkeepers. Then they have been taken to the States where the acute American mind has seen their market value. Then they have been put into production and made a business proposition. Then they have come back here, often masquerading as American inventions, or at any rate with American prestige. And then some bright English manufacturer has taken hold of them, has paid the Americans a lot for them, and has made a really perfect job of them, and incidentally has made his fortune.

For example, we had the first electric railway. The New York Overhead and the New York Underground are a disgrace to a civilised nation. And our Tubes, which were built by Englishmen under American supervision, are the most perfect things of their kind in the World.

We made the finest boots in the world for centuries. But when I was a youngster I could never get a pair that fitted whether I paid three guineas to have them made or a guinea ready made. The Americans started making quite good boots and shoes in quarter sizes and four widths each, and they made cheap shoe-trees which kept them in shape. They flooded the English market with them and took millions of pounds out of this country. And now you can get an English shoe which is better and cheaper than anything in the World.

For centuries we have made the best steel in the World. The German scientists showed us how to temper razors properly. We invented the safety-razor and looked on it with scorn alongside the old-fashioned hand-knife. The Americans made the safety-razor a working proposition. And now you can use any old safety-razor with an English Darwin blade in it, and it is the finest shaving apparatus in the world.

The English housewife made the most delicious simple household sweets. The Americans took them and turned them into ornamental candy, and even opened shops in England to sell them. But there is nothing to touch Fortnum & Mason's modern products.

An Englishman invented the steamship, but it was the Americans who made steamships work. And the Americans built cheap steamships for years. But to-day there is not an American steamship on the water that compares with the products of Belfast and the Clyde.

Let us hope that the same thing may happen with our aeroplanes. Sir George Cayley made an aeroplane about eighty years before the Wrights were born. The Wrights were taught just about all they knew by a Frenchman. And the Americans made aeroplanes fly before we did. But we made, and still make, the best war-machines.

The first passenger-carrying aeroplane with proper cabin accommodation was built immediately after the War by Mr. Koolhoven, a British subject with English ancestors. Now the Americans are making commercial aeroplanes by the thousand before we have produced one which is actually on the market.

We shall probably have to wait a while before we beat the Americans at their own game, in accord with history. The question is whether we are going to let them make a fortune out of our Overseas Dominions, and out of this country as well, while we are thinking about it.—C. G. G.

THE LOSS OF THE "CITY OF ROME."

The Under-Secretary of State for Air, in the House of Commons on Nov. 13, replying to a question by Mr. Lees, made the following statement:—

A report upon this most regrettable loss has been received from the British Consul at Spezia, through the Consul-General at Genoa. It goes to confirm the view that the immediate cause of the loss was the breaking of the tow-line which the captain of the Italian steamer *Famiglia* had succeeded in passing to the flying-boat, the subsequent inability of the *Famiglia* to find the flying-boat again in the darkness and heavy weather, and the eventual foundering of the flying-boat in the gale. It throws no light on the initial cause of the disaster, the forced descent upon the water. It is known that one of the engines developed some fault, and finally stopped, but, in view of the complete loss of the flying-boat, the reason for this can hardly now be ascertainable. The answer to the last part of the question is that I have no reason to think that anything more could have been done than was done in the very difficult conditions that existed, but I understand that this aspect of the matter is being examined by the Italian authorities.

SERVICE PILOTS AND AIR TRANSPORT.

An ex-Service reader writes thus on the discussion last week of some recent accidents:—

I realise, of course, that you are apt to seize on half-truths, and with your fertile brain, enlarge and distort them until they are full-grown untruths.—For example the famous and astonishing explanation of why the Italians couldn't get round the corners in the Schneider Cup.—But don't you think that this attack on the Short Service bloke is rather too much—As usual you have a half-truth and have made us, and therefore the System of Service Training, as dust before the Editorial Storm: also it savours rather of hitting someone who can't hit back: those in the Service may not, and those who are out would not.

Also you might persuade people who didn't know anything about Service flying that you were correct: your manner is apt to be so convincing for the uninitiated!

As regards the Imperial Airways crashes, I have heard another account of Woodbridge's crash at Jask, and it differs so much from your surmises that I prefer to wait for the official account.—But if you are holding "Woodie" up as an example of a slap-dash ex-R.A.F. pilot who cannot become a commercial pilot, its a gross untruth: I knew him well, and "Safety First" was very much his watchword.

[There is a vast difference between a slap-dash pilot and one who makes a mistake. This instance was quoted, on very recent evidence, as an example of how even the best pilots can make mistakes. We have had lately the cases of Charles Jones and John Clarke to emphasise this unhappy fact.—C. G. G.]

As regards the loss of the *City of Rome*, I feel perfectly certain that the story of the grass line is incorrect or very incomplete. Birt would have realised that there was a heavier line attached to it: he was no fool: he had had plenty of seagoing experience and it is libelling the dead to insinuate that he was incompetent.

[This was an instance of sheer lack of knowledge. Mr. Birt had served for one year with flying-boats. He was an excellent pilot but not a seaman by training.—C. G. G.]

Also I have an idea that you are wrong in your account of how Kidston got away.—The Junkers people told me a tree cut the belly open and Kidston fell out!

[The account in The Aeroplane was Lt. Cdr. Kidston's own.—C. G. G.]

To say that the modern R.A.F. pilot is slap-dash—ham-handed—and a trifle careless is untrue also: there *are* exceptions I know—but even with all the editorial aids and assurances I'd like to see some of them "slamming" 9as—or Grebes or Siskins onto the ground—and have you ever tried to "pull" a heavily loaded Vernon off the ground?

[What was said was that Service pilots were *apt* to become so, by the nature of their work.—C. G. G.]

The trouble appears to be that you simply don't know enough about Service flying. In matters of Policy nearly every one reads, and very often, admires, you as correct—but I'm afraid that they don't ever take your flying paragraphs seriously: there have been too many mistakes in the past.

[Then the mistakes have been those of pilots with many years' more experience than the writer of the letter has had. One never writes of flying except as expressing the opinions of pilots.—C. G. G.]

As regards the suitability of ex-R.A.F. people for Civil flying, it seems to me that you have missed one of the most salient features.

On the present type of Short Service officer the effect of Service Training should produce much the same degree of efficiency as regards flying ability.—The reason that some pilots are better than others is that their ability is dependent on individual common sense: consequently if a civilian firm wish to engage an ex-R.A.F. pilot, they will find many with similar flying records, and they must make their choice, not so much on hours flown as on their own estimation of the candidate's personal ability and common sense.

Your article does not allow for this: you damn all under the ham-handed, slap-dash heading: the young scout pilot is classed with the old, overseas, "twin" expert, and when you point a moral in the foolishness displayed by someone in trying to take off with too short a run, you seem to forget that a bloke who does that would probably have done it whether he was Service Trained or not.

Your article gives the impression that if a Service pilot breaks an aeroplane it is a signal for a complimentary guest night—instead of the father and mother of all chewings-up by the Flight Commander—Squadron Commander and Station Commander, and a few kind words added by the staff of A.R.S.

I can assure you that the modern ex-S.S.C. officer is anything but the wild, thoughtless and slap-dash pilot of your imagination, and unless he is very much the exception, any one of them who has had suitable Service experience would make just as satisfactory civilian pilots as a man trained in civilian schools. [Those who have seen some of the flying by ex-Service, and serving, pilots at certain flying meetings this year will not agree.—C. G. G.]

I know that you'll rend this—your journalistic ability is too high for you not to be able to do so, with the greatest of ease—but, never mind, the time when I hoped for your conversion is long since past and I shall read The Aeroplane just the same, and get a hearty laugh from the Editorials just as before.

I hope you'll accept this in the spirit in which it's written: primarily as a defence of two who cannot reply, and many who may not—and secondly in the quite hopeless endeavour of persuading you to get someone else to write up your practical and theoretical flying for you.

[Good Lad! One always admires a man who has the courage of his convictions. As a matter of fact we are both right. Probably the ideal commercial pilot for an air-line is the well-seasoned N.C.O. pilot who has served on over-loaded twin-engined machines in hot countries. But he is difficult to find. And the pilot of the "officer" class is apt to be too impatient for regular flying over the same old route till he retires on pension. So the remedy seems to be an Air Traffic Pilots' School, to weed them out,—not to train civilians *ab initio*.—C. G. G.]

OVERSEAS TRADE AND CO-OPERATION.

BY GERALD N. DEANE.

[The following article by Captain Gerald Deane is of particular interest in these days when we hear so much of a great effort to capture foreign markets for the British Motor Trade. It points a way by which those markets can also be captured by the Aircraft Trade. But there is a difference in the methods.

Captain Deane suggests co-operation,—which means that the bulk of the profits would remain with the Aircraft Constructors themselves. The Motor Trade method seems to be rather to let the profits go into the pockets of an enterprising selling syndicate or firm which is prepared to take risks which the motor-makers themselves have not the enterprise to take themselves.

The Motor Trade, by copying, and possibly improving, American specifications, so as to make their cars suitable for foreign markets, will probably get the business. The question is,—will the Aircraft Trade likewise build what the buyers want, and will they grasp the opportunity which is now offered of getting the business before America gets it?—C. G. G.]

From time to time this Journal has published leading articles on the subject of sales of British aircraft material abroad, and certain references which have been made recently to the desirability of a more lively co-operation between the individual manufacturers who constitute the Aircraft Industry, prompt me to frame a reply.

I have for some years represented various British aviation interests and their allied trades in Latin America, and though the conditions are similar to those in other parts of the world, I think that if we established our position and British Standards there, we could easily hold our position in other portions of the globe, in the face of American and Continental competition.

One thing is fairly certain, unless we are prepared to establish a British Standard within the next five years, and then carry on in an increasingly energetic manner, it will be much better for the Aircraft Industry to spend money in consolidating their position within the British Empire, where they have a definite pull.

In Latin America, there are about a dozen countries operating Service aircraft with either naval or military establishments, which are run (some of them) on quite modern lines. Their aerodromes are well equipped with hangars, machine-shops and machines.

Whether British Service aircraft are in use or not, they certainly have a reputation for being ahead of those manufactured by other nations. Most of the responsible Authorities with a knowledge of the subject prefer something manufactured to British Standards, and wherever they can afford to purchase them, a Latin-American Government will purchase British-built types.

I do not for a moment suggest that orders are taken for this class of material unchallenged by American or Continental competition. In fact it is fairly evident that no stone is left unturned, even to the point of several foreign firms combining together, to defeat British interests.

In a way we shall always be faced with a certain form of competition, for no Continental or American concern will ever admit that their respectively competitive goods are in the least sense inferior. For example, if it is French it is magnificent anyway, no matter whether the French representative is discussing his own firm's make or that of some other French firm!

This I have found, is a policy rather different from that followed by certain British firms' representatives, as well as by the agents representing them, who frequently criticise anything competitive, whether British or Foreign. This policy, I need hardly say, re-acts most unfavourably against us.

THE SUPERIORITY OF BRITISH TYPES.

Now there is absolutely no doubt that British Service types *are* ahead of anything manufactured by other countries; for though we avoid multiplicity of types, nevertheless each individual type is capable of great flexibility of service. In fact certain general-purpose types have actually been called upon to perform numerous tasks for which the designer never originally intended them.

Take for instance, the development of one of our best-known seaplanes:—

In its numerous forms this machine has been fitted with pretty nearly every type of British engine and several foreign ones. Originally produced as a two- or three-seater reconnaissance seaplane for operating from an aircraft carrier or from the shore, it can be either lowered over the side of a naval vessel for a take-off, or can be catapulted into the air.

It can be fitted with the standard undercarriage, either split or cross-axle type, or with skis, and no doubt it would be perfectly possible to fit it with amphibian gear if necessary.

The standard machine is equipped for reconnaissance, bombing, and ground-straffing duties. It carries radio and complete photographic apparatus. And it can also be operated as a single-stretcher ambulance machine.

It is just as good a landplane as a seaplane. And it must be remembered that a well-designed seaplane will always convert satisfactorily to a landplane, though a machine designed as a land-plane seldom gives complete satisfaction if subsequently fitted with floats.

The machine has been operated by the R.A.F. in all parts of the world, and a large number of them have been supplied to overseas governments, including South American.

For this very reason English aircraft are always more expensive than foreign,—which point is quite naturally emphasised by foreign competitors who are compelled to use a complexity of types to fulfil a similar range of duty.

Owing to the amount of military equipment carried, the range of the average British Service machine is usually less than that of a complementary foreign type. And, though we can more than hold our own in performance carrying a given weight, nevertheless, when it comes to speed competitions, ours are not so easily stripped for the fray as the American machine which carries a minimum of military etceteras,—in lieu thereof they allow for a greater capacity for fuel and oil, and consequently attain about twice the range. So much for types.

SALES POLICY.

Now as regards sales policy:—

One is quite familiar with the usual argument put forward against co-operation between manufacturers, namely, that sooner or later there would be a clashing of interests if similar types were offered simultaneously against a foreign inquiry. In England, where firms are competing on an Air Ministry Specification, this argument applies. But there is plenty of evidence of one machine being superior to another. And when the placing of a production order is concerned, they really differ considerably.

The thing to emphasise is that in competing for foreign business, the British Aircraft Industry is firstly up against foreign competition, and to establish the British Standard it is absolutely necessary to present a combined front against this competition. To do this effectively we shall have to trot out the finest machines both in design and performance that we possess, and then quote a price which will be within the means of our overseas customers.

I think it is the greatest calamity that money should be spent by any firm in submitting a design which has been one of the "also rans" in one of our Air Ministry competitions. Even if we do manage to sell such a machine it will be easily bettered and shown up by some foreign with a machine which is not half as good as our best.

It does not necessarily say that our best Service type will always be suitable. But until we have found out that the specification cannot be covered by one or other of our best Service types, it is a great mistake to submit anything else.

TEAM-WORK.

The most satisfactory method yet devised by Commerce for disposing of, and distributing, goods in one's own and in other countries, is by wholesale and retail trading,—to the cost of which the customer contributes when purchasing the goods.

Many customers have thought it convenient to go direct to the manufacturer as soon as their minds had been made up for them as to what should be purchased. And this power of influencing the mind of the buyer is what is known as salesmanship.

There is no doubt that in the early days of commerce, the customer was ready to give his decision without interference. But in these days where you have sales propaganda both direct and indirect, emanating not only from one's own people, but from various foreign competitors as well, it has become vitally necessary to keep the lines of communication open by a highly efficient sales organisation co-opting a multiplicity of interests, both technical and commercial,—and one must perhaps include diplomatic.

In selling aircraft material, these members of a British team would be the firm's representative, the local agent, and our Government Departments respectively. Without close co-operation between this team and the manufacturer, the selling of aircraft is likely to be of a very spasmodic nature.

PRESENT METHODS.

The present system is to engage an agent in one of the buying countries to keep in touch with Government Air Forces and uncover inquiries,—for which service commission is paid at varying rates. Occasionally the agent's and his customer's interest is stimulated by the co-operation of a travelling representative from home, who is either making a general tour of a number of countries, or has been sent

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

PERFORMANCE FIGURES

ATLAS WITH JAGUAR ENGINE AND TOWNEND RING

Fuel, 75 gallons (337 litres). Oil, 7 gallons (32 litres). Military Load, 880 lbs. (400 kgs.)

out specially to assist in obtaining some important contract.

There have been several occasions upon which a representative has actually visited countries in South America, and pulled off important contracts independent of any agent, —but these occasions unfortunately have been rare. On the contrary, it usually takes anything from eighteen months to two years for an order to mature from a firm inquiry.

The rates of commission paid by individual British manufacturers to local agents have usually been more modest than those paid by foreign competitors. But owing to the fact that much spade-work has to be done, and a certain amount of risk has to be taken in submitting some particular type (which may or may not be successful in obtaining the order), applications have occasionally been made for an increase.

It will be readily understood that the agent has to cultivate the acquaintance of the influential authority responsible for the eventual placing of a contract. It is also evident that more than one firm cannot participate in the same order. The amount of commission which has to be added for the agent, ought therefore to be sufficient to prevent him from concerning himself with the promoting of easier business. But the addition of more than a normal amount of commission may quite easily prejudice the placing of a contract,—especially when a British price is already considered sufficiently high.

Our foreign competitors can always quote a cheaper price. They invariably allow their agents substantial commissions, and even then their prices are competitive in comparison with ours. There are, however, a number of solutions to this difficulty.

The Right Way.

If the British firms would pool their sales effort, and promote an intelligent sales policy, suitable agents could be chosen and given a range of material which would cover all the normal aviation requirements of these South American countries. Their chances of obtaining regular business would be enhanced. And the commissions paid could be reduced to a minimum figure.

If the selling team were allowed to work together mutually for a sufficiently reasonable period of, say, not less than five years, there is no doubt that our position would be firmly established ahead of our foreign competitors.

It would be necessary to employ a limited number of agents, and these would have to be carefully chosen. Between them they would cover not only aircraft, aircraft-engines and equipment, but also semi-raw usable stores, and all installation and apparatus comprised in the make-up of the Aviation Service—Naval, Military and Civil.

In South America, it would be necessary to have technical regional representatives, who would not only study the requirements of each individual case, but would also study the commercial features underlying the placing of the different contracts.

The lines of communication between the British manufacturer and the local organisation would have to be kept open by occasional visits of individual firms' representatives,—or, better still, by one or more officials representing the Industry as a whole.

The duty of these officials would be to study the developments of aviation in all its branches and to keep in touch with the firms which compose the Society of British Aircraft Constructors. They would also be in touch with British official Departments, such as the Board of Trade and the Royal Air Force, who would render them every facility for keeping thoroughly up to date.

Their additional duties in South America would be to strengthen their connection with the various officers composing the different Air Forces. They would do their best to bring the manufacturer and the purchasing commissions together, and to keep the negotiations alive and in a fluid state from the inquiry stage to the closing point.

Local agents would naturally be in competition with one another, but this would be a perfectly healthy arrangement, if they were made to understand that they were working for the British Industry. And if they were given a sufficient range of material to sell they would presumably benefit in turn. The same competition exists at the present moment in any case, and I do not think it is desirable to try to eliminate it.

I think the commission on articles should be the same for all agents, and that to become a British Aircraft Industry agent each of them would have to learn to work on a definite system.

Much more could be done by the Members of the British Aircraft Industry if they were acting as a body than as separate individuals. They would occupy a different place and they could command a certain amount of influence from telegraph companies, railway companies, Government authorities and so forth. And in England I am sure there is no question that we could obtain the co-operation of Government Departments, as well as assistance from Foreign Office Representatives in all the countries concerned.

As it happens, the scheme mentioned above has actually been in operation by some Trades for many years, and in the present state of South American trade there is nothing to touch it. Even with such co-operation we shall still have an uphill fight to establish our position. Establish our position we certainly will, though there is no other possible manner so far as I can foresee.

THE ROYAL AERO CLUB.

The following members of the Royal Aero Club have been co-opted to fill the vacancies on the Club Committee:—Mr. H. S. Broad, Major C. J. W. Darwin, Major A. R. Goodfellow, Mr. A. H. Downes-Shaw.

The Committee of the Royal Aero Club has had under consideration certain matters of interest, to wit,—the Schneider Contest in 1931, the King's Cup Race in 1930, the revival of the Aerial Derby in 1930, Municipal Airports, and the Guild of Air Pilots.

The function of the Royal Aero Club is to control the Sport of Flying. Therefore just how Municipal Airports come within the purview of the Royal Aero Club is a question which naturally arises. Presumably Municipal Airports may be used for sporting flying meetings in the future, and as landing places in cross-country races.

How the Guild of Air Pilots comes within the radius of action of the Aero Club is less easy to explain. There seems to be little community of interests between professional air pilots and navigators, such as the members of the Guild, and the purely sporting interests of the Royal Aero Club.

THE AGA KHAN PRIZE.

H.H. The Aga Khan has offered, through the Royal Aero Club, a Prize of £500 for the first flight from England to India or *vice versa* by a person of Indian Nationality.

It must be a solo flight, completed within six weeks from the date of starting. The prize will remain on offer for one year from January 1, 1930.

[The question arises, naturally, what is Indian Nationality? If birth be the qualification, then a pure-blooded Englishman born in India may try for the prize. If not, then Punjabis, Pathans, Parsis, and descendants of the Moghul monarchs and their followers, must be disqualified on the ground that they do not racially belong to the people of Hind. And if the contest be confined to those who are of the indigenous people East of the Indus the prize will never be won, for the good reason that no Dravidian is ever likely to get an aeroplane into the air and down again in one piece. A definite ruling on this subject is needed at once.—C. G. G.]

CHRISTMAS CARDS—A REMINDER.

Readers of The Aeroplane are reminded that if they are going to send Christmas Cards to friends in the British Dominions overseas they had better get them off at once. Naturally readers of this paper would rather send cards of an aeronautical character than anything else, and by far the best cards of that sort are produced by the Aircraft and General Fine Art Co., Constitutional Buildings, East Grinstead, Sussex.

Mr. W. E. Johns, the head of the firm, was a pilot in the R.A.F. for a number of years, during the War and after which accounts for the fact that his pictures are always alive, and are so different from the pictures one often sees of aeroplanes which look as if they were stuck on to the sky.

His Christmas Cards this year are particularly striking. He has made great use of our Schneider Trophy winner, the Supermarine Rolls-Royce S.6, and somehow manages to convey a proper impression of its speed in all sorts of different positions. Also he has a wonderful selection of light aeroplanes and of standard Service aircraft. His latest catalogue shows how well he can supply everybody's needs.

A METALLURGICAL OCCASION.

On Thursday, Nov. 21, 1929, Mr. L. W. Johnson will read his paper on "The Inspection of Metals and their Alloys" before a joint meeting of the Royal Aeronautical Society and the Institution of Automobile Engineers at the Royal Society of Arts, John Street, Adelphi.

All those wishing to attend are particularly asked to notice the change of time for the start of the lecture. This will be at 7.45 p.m. Light refreshments will be served in the Library from 7.15 p.m. onwards.

Mr. Johnson will review the various types of material tests available to the inspector, and what these tests can tell. He will also outline the different kinds of defects found in metals.

The lecture will be illustrated with slides, a number of which show very interesting macro-sections of components in various stages of manufacture.

THE PULLMAN OF THE SKIES

The Avro 10 is the British version of the Fokker F7-3M. It embodies all that is excellent in modern air travel, comfort, speed and great reliability under all climatic conditions. It is equipped with three 230 h.p. Armstrong-Siddeley engines and the whole machine is British built to the Air Ministry's standard of airworthiness. This type is used by the Dutch, Swiss, Italian and Canadian air lines and has recently been selected for passenger and freight service by Australian National Airways Ltd., who have ordered four Avro 10's for passenger and freight traffic on their Brisbane to Sidney route.

AVRO·10

Cruising speed 100 m.p.h. Range from 400 miles upwards.
Payload up to 2000 lbs.

Specifications and full particulars both of the above plane and of the Avro 5 (seating pilot and four passengers) will be supplied on application. Those interested should write also for special catalogue of the famous "Avian" light aeroplane.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, November 12.

ROYAL AIR FORCE.

ENERAL DUTIES BRANCH.—P. F. Canning is granted a S.S. comn. as lt. Off. on probation with effect from and with seniority of Oct. 21. following Plt. Offs. are promoted to the rank of Flg. Off.:—). G. Freeman, A. J. P. Groom, A. D. Jaffe, G. E. F. Proctor (Oct. D. A. L. Campbell, P. Le M. C. Deacon, J. W. Hawke, H. J. A. liams (Oct. 13); F. R. Balfour (with seniority of Oct. 13) (Oct. 18). he following are promoted with effect from Oct. 13:—FLT. LTS. TO Sq. LDRS.:—E. B. Grenfell, A.F.C., P. F. Fullard, D.S.O., M.C., .C., H. O. Long, D.S.O., V. R. Gibbs, D.S.C., C. E. W. Lockyer, Buxton, O.B.E., H. B. Russell, A.F.C.

LG. OFFS. TO BE FLT. LTS.:—E. A. Healy, F. E. Nuttall, V. Harris, W. B. McDonald, H. F. Jenkins, L. W. Dickens, D. A. Boyle, Ll. R. Atcherley, H. R. D. Waghorn, A.F.C., J. M. Cohu, G. B. M. ind, R. P. P. Pope, D.F.C., J. H. Powle, J. H. Sender, J. L. F. Fuller-d.

lt. Lt. G. G. H. Du Boulay is placed on the retired list at his own uest (Nov. 1). Flg. Off. H. T. Satterford is placed on the retired on account of ill-health and is granted permission to retain rank of Flt. Lt. (Oct. 1). (Substituted for the notification in the *ette* of Oct. 1.) The following are transferred to the Reserve, ss A:—Flt. Lt. S. D. Scott (Nov. 8); Flg. Off. S. A. Thorn (Nov. 4). J. S. Martin, R.M., Flg. Off., R.A.F., relinquishes his temp. comn. return to duty with the Royal Marines (Oct. 25).

ccountant Branch.—Flt. Lt. (now Sq. Ldr.) R. Byrne, M.C., is nted the acting rank of Sq. Ldr., with pay, whilst employed as nmand Accountant, Aden (May 27, 1928).

EDICAL BRANCH.—Flg. Off. H. D. Humphreys (Temp. Lt., General t. Army) is promoted to the rank of Flt. Lt. (Dental) on pro-tion to the rank of temp. Capt. in the Army (Jan. 27). (Sub-tuted for the notification in the *Gazette* of Oct. 29.)

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—A. T. Laws is granted a comn. in the ecial Reserve as a Plt. Off. on probation (Oct. 14). The following . Offs. of the Special Reserve are promoted to the rank of Flg. :—N. A. Lindley (Aug. 3); G. A. Worth (Sept. 12).

The following are transferred from Class A to Class C:—Flt. Lt. A. Hale-Monro (Nov. 12); Flg. Off. H. C. E. C. P. Dalrymple (Nov. 8); g. Off. A. H. Grace (June 23). Flt. Lt. F. C. Wilkinson is trans-rred from Class B to Class C (Nov. 11); Flg. Off. K. E. Shelley re-nquishes his comn. on completion of service (Sept. 11); Plt. Off. F. Canning relinquishes his comn. in the Special Reserve on ap-ntment to a S.S. comn. in the R.A.F. (Oct. 21).

MEDICAL BRANCH.—The following relinquish their comns. on com-etion of service:—Flt. Lt. J. G. F. Heal, M.D. (Aug. 1, 1928); g. Off. H. W. D. Mackenzie, M.B. (Sept. 9).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 600 CITY OF LONDON (BOMBER) SQUADRON.—The following Plt. Off. to be Flg. Off.:—R. Faulds (Oct. 5). No. 602 CITY OF GLASGOW (BOMBER) SQUADRON.—The following Plt. Offs. to be Flg. Offs.:—J. K. Horsburgh (Sept. 14), A. D. McNab (Oct. 12). No. 603 CITY OF EDINBURGH (BOMBER) SQUADRON.—The following to be Plt. Off.:—T. M. McNeil (July 22). (Substituted for the notification in the *Gazette* of Oct. 11).

Appointments.

Week ending November 18.

GENERAL DUTIES BRANCH.—Air Vice-Marshals F. R. Scarlett, C.B., D.S.O., to H.Q., R.A.F., Middle East, on appointment as Air Officer Commanding, 25/10. A. E. Borton, C.B., C.M.G., D.S.O., A.F.C., to H.Q., Inland Area, on appointment as Air Officer Commanding, 2/11.

Group Captain A. W. Bigsworth, C.M.G., D.S.O., A.F.C., to No. 10 Group H.Q., Lee-on-Solent, to command, 1/11.

Wing Commanders W. B. Hargrave, O.B.E., to Station H.Q., Andover, to command, 21/10. L. D. D. McKean, O.B.E., to Air Ministry (D.O.I.), for Air Staff duties, 18/11.

Squadron Leaders H. S. Kerby, D.S.C., A.F.C., to Air Ministry (D.O.I.), 1/11. J. J. Breen, to No. 33 Sqdn., Eastchurch, 27/10. J. B. Cole-Hamilton, to No. 13 Sqdn., Netheravon, 1/11.

Flight Lieutenants R. J. H. Holland, to No. 503 Sqdn., Lincoln, 1/11. W. J. Richards, to No. 22 Group H.Q., S. Farnborough, 4/11. R. A. B. Stone, to Home Aircraft Depot, Henlow, 28/10. J. S. L. Adams, to No. 19 Sqdn., Duxford, 21/10. M. C. W. C. Flint, M.C., to No. 30 Sqdn., 'Iraq, 1/10.

Flying Officers W. E. Symonds, to R.A.F. Depot, Uxbridge, 3/9. A. G. C. Somerhough, to R.A.F. Base, Kai-Tak, 20/7. J. B. Mackenzie, to No. 33 Sqdn., Eastchurch, 11/10. F. S. Homersham, D.C.M., M.M., to R.A.F. Depot, Uxbridge, 29/9. J. A. P. Harrison, to No. 45 Sqdn., Middle East, 6/10. P. de C. Festing-Smith, to No. 216 Sqdn., Middle East, 6/10. H. D. Mitchelmore, to Home Communication Flight, Hendon, 19/9. A. J. Brister, to No. 111 Sqdn., Hornchurch, 25/10. G. H. Huxham, to No. 10 Sqdn., Upper Heyford, 24/10. W. S. Calder, to No. 30 Sqdn., 'Iraq, 1/10.

Pilot Officers F. C. Edney-Hayter, to No. 7 Sqdn., Worthy Down, 23/10. F. P. Hewitt, to Andover Communication Flight, 14/10. P. F. Canning, to No. 207 Squadron, Bircham Newton, on appointment to a S.S. Comn., 21/10. J. A. Nicholson and G. W. Stranraer-Mull, to No. 4 F.T.S., Middle East, on appointment to S.S. Comns., 23/9. The following Pilot Officers are all posted to No. 3 F.T.S., Grantham, with effect from 26/10:—C. F. G. Adye, C. P. F. Alderson, I. O. Baldwin, J. N. Baxter, N. V. Bertram, B. W. E. R. Bonsey, M. Q. Candler, W. O. J. Coke, V. A. Dawson, C. C. M. Dunman, T. E. Dunville, F. P. R. Dunworth, N. Foster-Packer, H. M. Gahan, F. B. H. Hayward, N. Hill, M. V. Johnstone, N. D. Lamb, G. W. Lawson,

Medical Branch.—Flight Lieutenants J. G. Skeet, to R.A.F. Depot, Uxbridge, 4/11. J. T. T. Forbes, to H.Q., 'Iraq Command, 26/10. E. P. Carroll, to Wireless Station, Ismailia, 15/10. G. S. Strachan, M.B., to No. 1 (Indian Wing) Station, 26/9. W. S. Stalker, M.D., D.P.H., to R.A.F. Depot, Uxbridge, on appointment to a temp. comn., 21/10.

Stores Branch.—Flight Lieutenants H. Parker, to No. 4 Stores Depot, Ruislip, 12/10. A. T. Shaw, to No. 1 Stores Depot, Kidbrooke, 23/10.

Flying Officers A. M. Reidy, to Station H.Q., Upper Heyford, 1/11. A. E. Connolly, to No. 45 Sqdn., Middle East, 9/10.

Accountant Branch.—Flying Officer E. L. G. Le Dieu, to Night Flying Flight, Biggin Hill, 18/10.

Chaplains Branch.—The Rev. C. A. Smith, to H.Q., R.A.F., Cranwell, on appointment to a S.S. Comn., 18/10.

The West African Flight.

A Flight of Fairey III.F aeroplanes of No. 45 (Bomber) Squadron, R.A.F., under the command of Sq. Ldr. F. J. Vincent, D.F.C., left Helwan, Egypt, on Oct. 19 for a flight to Nigeria and the Gold Coast.

The Flight arrived at Khartum on Oct. 20.

The next news of the Flight stated that the machines left Lagos on Nov. 13 for Cairo. They had flown from Accra to Lagos.

No. 45 (Bomber) Squadron is mainly equipped with D.H.9as, but three machines of its new equipment were used for this flight.

[The route to Nigeria and the Gold Coast is best described in the words of a Cairo-to-Kano pilot, who in answer to a Cairo-to-Cape-Town pilot's question about how one gets to Nigeria, said:—"You know the way to Khartum? Well! When you get there you turn sharp right, and keep straight on."]

No. 8 (Bomber) Squadron.

Demonstration flights by machines of No. 8 (Bomber) Squadron were made over an area north of Assauda, between Dala and Aden, where trouble was experienced with the Koteibi tribe during September. The tribesmen had been interfering with the traffic and looting caravans on the road and had taken no notice of the warnings given them. Air action was taken at the request of the Sheikh, and following it no further trouble occurred.

No. 30 (Bomber) Squadron.

No. 30 (Bomber) Squadron, R.A.F., moved from Hinaidi to Mosul, 'Iraq, on Oct. 23, 1929.

No. 30 (Bomber) Squadron is commanded by Sq. Ldr. H. P. Lale, D.S.O., D.F.C., and is equipped with D.H.9as.

No. 203 (Flying Boat) Squadron.

A flying boat of No. 203 (Flying Boat) Squadron, Basrah, flew from Basrah to Mosul and back during July. The machine alighted at Hinaidi, where it stayed the night and on the following day alighted on the Tigris at Mosul. Various alighting and taking-off tests made on the river at Mosul proved that flying boats could be operated there during the greater part of the year.

One machine of this Squadron flew to Karachi in August with Air Marshal Sir Geoffrey Salmond, Air Officer Commanding R.A.F., India, as a passenger. The route taken was *via* Bahrein, Umm al Qaiwain, Ras al Khaimah, and along the coast of Oman to Muscat, and thence to Gwadar, where the machine was refuelled without difficulty in spite of a bad swell on the water. The trip took three days.

On the return journey sites were inspected for landing grounds at Sohar and at Yas Island. At both places suitable sites were found.

No. 205 (Flying Boat) Squadron.

Monthly cruises by flying-boats of No. 205 (Flying Boat) Squadron, Singapore, have been made during the last few months to gain practical experience of weather conditions from an aviation point of view during the whole of the monsoon period, over the proposed air mail route from Singapore to Calcutta.

One machine left Singapore for Calcutta on August 6 and returned on August 21. Another machine left on Sept. 3 and returned on Sept. 18. On both cruises the machines alighted at Penang, Mergui, Rangoon, Akyab, and Chittagong.

The conditions experienced during the cruise to Calcutta in August showed a marked difference from those met on a similar cruise in June. The worst conditions so far experienced occurred during the return trip from Calcutta in August, during which the monsoon rain was particularly heavy.

Flying through this rain is said to be somewhat similar to flying in fog, with the added disadvantages of a strong wind, bumpy air, and the discomfort of the rain beating in the pilot's face. In spite of these conditions, the aircraft adhered to the time-tables of the flights with only minor alterations.

Seaplane Trials in the Southern Sudan.

The following note appears in the November issue of the *Journal of the Royal United Service Institution*:—

Further trials of aircraft fitted with float undercarriages were carried out in the swamp areas of the Sudan during August. The aircraft proceeding from Khartum, visited Malakal, Shambe, Yirrol, Mala-Wan, Lake No, Nasser and Ahwong, successful landings being made at each of these places. A certain amount of difficulty was experienced in taking off which it is hoped to overcome by the use of improved propellers and floats. As a result of these trials it is considered that the use of float planes is possible in most places in the Southern Sudan during the rainy season, which will enable aircraft to operate in the swamp areas which have hitherto been inaccessible to any form of military force.

The Squadron stationed at Khartum is No. 47 (Bombay) Squadron which is equipped with Fairey IIIFs, machines designed for land or water undercarriages.

Some Sidelights on the Schneider Contest.

On Nov. 15 Squadron Leader A. H. Orlebar, A.F.C., gave a lecture at the R.A.F. Station Cinema, Cranwell, on the contest for the Schneider Trophy. The lecture was illustrated by lantern slides and a short cinema film. In addition to the Commandant, officers, civilian staff, cadets and airmen of the Cadets' Wing, Cranwell, the audience included the Commandant of the Royal Military Academy, Woolwich, and the Rugger and Soccer teams from Woolwich who were playing Cranwell teams the following day.

A good deal of the information contained in Sq. Ldr. Orlebar's extremely interesting lecture has already been published in this and other journals, but one or two points are of interest.

Describing the training of the pilots selected for the team, the Lecturer said when they were appointed to the High Speed Flight none of them, with the exception of Flt. Lt. Greig, had ever flown seaplanes. They had started training with a dual-control seaplane, and had then gone onto Flycatchers with floats. From that they had gone onto the high-speed practice machines

Except for taking off and alighting, flying high-speed machines was very much like any other sort of flying. The first stage in taking off was rather unpleasant, especially if the sea was not very calm, as the machine pitched about and very often water was thrown back over the fuselage and a good deal of it went down the back of the pilot's neck. The second stage when the machine was up on the step was quite pleasant.

With regard to the personal training of the pilots, nobody knew much about training high-speed pilots, and they had taken things in a fairly free and easy manner. They had knocked off alcohol, which was not very difficult as three of them were teetotallers anyhow and the others did not care either way, and they had cut down smoking to a minimum, again not very difficult as three of them were non-smokers. They had taken ordinary exercise and had kept away from the sheds when there was no flying on. They had refused offers of massage.

Describing the delay in the arrival of the competing machines he said that delay in these affairs could be easily understood. They were built to specifications which were continually being altered and amended. Naturally the designers would go on adding power and taking away weight until somebody at the Air Ministry, somebody very brave, called a halt. The Supermarine S.6 had proved very different from anything else they had flown because of its high-powered and low-geared engine. He described the various difficulties and trials with the new machines and how they had been overcome.

He had originally intended that each pilot in the Flight should try out every machine and then make his own choice, but in the end that had been impossible. Waghorn and Atcherley had definitely wanted S.6s, Stainforth had wanted a Gloster, and Greig had been neutral. So Stainforth and Greig had been allotted Glosters with the S.6 as a second string for Greig.

Interesting experiments on turns had been made while they were at Calshot. First of all they had flown over a *camera-obscura*, and after that they had done timed and measured turns over a spit of land. They had then drawn up a mean average between the time lost on a sharply banked turn and the time lost in covering more ground on a flatter turn.

Their experience had been that the problem of the pilot "blacking-out" on a sharp turn was not a serious one. A medical theory that black-out followed the loss of other faculties was not supported by their experience because they had found that in every case the pilot became normal again on resuming level flight and did not at any time lose consciousness. Stainforth was not subject to black-out at any time, to which might be due his reputation for having a cast-iron inside.

Describing the crisis which had arisen on the evening before the race when one of the Supermarine S.6 machines

ROLLS-ROYCE

AERO ENGINES

THE ADVANTAGES OF WATER-COOLING

6. *High Cylinder Output*

Equalized temperature throughout the water-cooled combustion chamber walls permits of a certain degree of supercharging when on the ground in order to improve the take off and rate of climb of an aircraft. This great advantage, which is only obtainable from a water-cooled engine, is clearly illustrated on the above curves which compare the power output of Rolls-Royce F type engines with and without supercharger.

ROLLS-ROYCE F and H

Digitized by Google

had been found to have a fragment of metal on one of the plugs caused by the scoring of the inside of one of the cylinders, the Lecturer said that the mechanics from the Rolls-Royce Company had already been working for four days and four nights without rest except for an odd hour's sleep now and again, and were in no condition to tackle such a tremendous job that night. With the help of the Police a party of mechanics from the Works at Derby, who were staying in and around Southampton to see the race, were raked up and brought to Calshot.

They immediately got down to the tremendous job of changing a cylinder-block at night and with the engine in the machine, a job which had never been attempted before. Everything was ready one hour before it was time for the machine to be taken out for the Race.

The Cost of the Schneider Trophy Contest.

In the House of Commons, on Nov. 15, in reply to Mr. Mander, who asked what was the total cost involved in British participation in the Schneider Trophy Contest, the Under-Secretary of State for Air said that it was not possible to give a precise answer as preparations for the Schneider Trophy Contest were inextricably mixed up with the official programme of development of high-speed aircraft and engines. As some indication of the magnitude of the cost, it was estimated that the Air Ministry would have spent at least £100,000 less in the last two years if there had been no question of the Schneider Trophy. The specific additional expenditure on accommodation, hospitality, and the like had been in the neighbourhood of £4,000. [But, on the other hand, we now have knowledge of what engines and aeroplanes and floats and pilots will stand which could not have been got in five years at five times the price by any other method.—C. G. G.]

The Kenley Collision.

In the House of Commons, on Nov. 11, Mr. Meller asked the Under-Secretary of State for Air whether he could give any information with regard to the circumstances in which two R.A.F. aeroplanes collided at Wallington on Nov. 7, whether stunt flying was taking place, and if so, would he see that manœuvres of this kind were confined to open spaces; whether he was aware that the aeroplanes carried machine guns loaded with live cartridges and that many of the cartridges had exploded in all directions to the danger of human life, and whether the carrying of live cartridges in ordinary flying practice was contrary to instructions, and, if not, could he give an assurance that the practice would be discontinued in time of peace.

Mr. Montague said that the accident had happened in the course of normal service exercises which had been carried out by two aircraft of a squadron stationed at Kenley aerodrome. This aerodrome was an integral part of the system of air defence of this country, and it was essential to the efficiency of the units stationed there that they should be able to carry out their training from their own aerodrome. It would be impracticable to limit such training to remote and unpopulated areas. The cartridges carried by one of the aircraft were part of its full equipment, practice in the carrying of which was again a necessary part of training. There had been no previously recorded instance in similar circumstances of cartridges exploding after impact, but orders were being issued to limit as far as possible in future the number of occasions on which live ammunition would be carried during training exercises.

Mr. Meller complained that the aeroplanes came too much over the populous districts near Wallington and not enough over the large tracts of Surrey and Sussex which were not populated. Mr. Montague said that the defence of London was of some importance.

Vacancies in the Auxiliary Air Force.

The termination of the four years' engagements of some of the non-commissioned officers and men of No. 601 (County of London) Squadron, Auxiliary Air Force, has resulted in a few vacancies in this Squadron.

Applications to join the Squadron are invited from men, preferably with experience of the aircraft or motor trades.

The town Headquarters of the Squadron are at 54, Kensington Park Road, W.11 (near Notting Hill Gate Station). The aerodrome is at Hendon.

The present equipment of No. 601 (County of London) Squadron is Avros and D.H.9as. The Squadron is shortly to be re-equipped with Westland Wapitis. Accepted recruits will be employed as riggers, fitters, and on W/T duties. Opportunities do not often occur to join this famous Territorial squadron, and suitable men are recommended to get into touch with the Adjutant without delay.

No. 3 Squadron Re-union.

The Tenth Annual Re-union Dinner of No. 3 Squadron, Royal Flying Corps, and No. 3 (Fighter) Squadron, R.A.F., will be held at the Hotel Cecil on Dec. 6 at 19.30 hours for 20.00 hours.

Air Chief Marshal Sir John Salmond, K.C.B., C.M.G., C.V.O., D.S.O., A.D.C., will take the Chair and Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C. has been invited as Guest of Honour.

Tickets at 12/6 (wines extra, gratuities included) will be obtainable at the dinner.

Former members of the Squadron who wish to attend should inform Flt. Lt. J. L. Airey, D.F.C., No. 3 (Fighter) Squadron, R.A.F., Upavon, Wiltshire.

Photographs of Northolt.

The Officer Commanding, R.A.F. Station, Northolt, is anxious to obtain copies of photographs of any groups of Officers, or Officers and Airmen, who have been stationed at Northolt Aerodrome during or since the War 1914-18.

Will anyone in possession of such photographs kindly communicate direct with the Officer Commanding, R.A.F. Station, Northolt Junction, Ruislip, Middlesex?

The Royal Air Force Quarterly.

The attention of intending contributors to the R.A.F. Quarterly is called, in an Air Ministry Order, to the following notice:—

All matter for the January number of the R.A.F. Quarterly should reach the Editor by Dec. 1, 1928. Dates of important Service functions, re-union dinners, sporting events, etc., and any notices of general Service interest will be published under "Forthcoming Events" in each number. Announcements for the period January to April 1929 should therefore be sent to the Editor without delay.

Rugby Football.

Woolwich v. Cranwell. — The annual Rugby Football match between the Royal Military Academy, Woolwich and the Royal Air Force College, Cranwell, was played at Cranwell on Nov. 16. The result was a draw, Woolwich scoring two tries (6 points) and Cranwell one try and a penalty goal (6 points). The match was watched by Major-General H. D. de Prée, C.B., C.M.G., D.S.O., Commandant of the Royal Military Academy, Air Vice-Marshal F. C. Halahan, C.M.G., C.B.E., D.S.O., M.V.O., Commandant of the Royal Air Force College, and a large number of officers of the Station, of past and present cadets, and of airmen and aircraft apprentices of the Station.

The Woolwich team were heavier in the scrum and faster in the three-quarter line, and, except for the fitness and energy of the Cranwell forwards and the undefeatable defence of the Cranwell backs, they might have won by a wide margin of points. The last line in the Cranwell defence was their Captain, Flt. Cadet Coote, who was moved from his place at half to full-back because he had been on the sick list and was not really fit to play. In spite of this he put up a splendid show.

The game was fairly even for the first fifteen minutes but steady pressure by the Shop drove Cranwell back until they were relieved by a long kick to touch by Coote who fielded a cross kick from a mark. Woolwich were getting the ball from nearly every scrum but their halves were closely marked and well tackled and they rarely got their threequarters on the move. When they did however, they gained a lot of ground and Cranwell had hard work to keep them out. Coote was a tower of strength at full-back and seemed to be always on the spot. He was well backed-up by the rest of his team. For a few agonising minutes Woolwich were right on the line and only after the second five-yards scrum had been formed did Cranwell clear from the danger zone. A heavy storm of rain blotted out the proceedings from the spectators for a few minutes and when it cleared Cranwell were holding their own. They got the ball from a line-out and made ground but Woolwich recovered from a scrum. Coote gathered the ball from the feet of the Shop's forwards and broke back on his own to nearly the half-way line. The next Woolwich attack was successful and they scored a try with a fine run in on the left wing. The goal kick failed. Cranwell recovered and had the best of the game for ten minutes following a brilliant run by Hodgkinson but just before half-time Woolwich scored a second unconverted try again on the left wing.

Cranwell scored early in the second half after some good work by the whole team with Elsmie particularly prominent and a fine run down the wing, punt ahead and run in by Walker. The goal kick failed. About ten minutes from the end of the game Coote kicked a beautiful goal from a penalty. The scores being even both sides made a desperate effort to get on top. The Shop, getting the best of every scrum by sheer weight, put Cranwell on the defence but every attack was broken up by the Cranwell tackling. By the end of the game both sides were played to a standstill.

The Cranwell team were:—Flight Cadets P. B. Coote, G. R. A. Elsmie, O. R. S. Bader, W. N. McKechnie, R. L. Wallace, C. E. J. Baines, N. C. Walker, J. O. W. Oliver, F. C. Daubeny, T. N. Cadet Robinson, W. H. Hodgkinson, W. Sawyer, E. A. de Pencier, M. W. S. N. E. Morrison.

Association Football.

R.M.A., Woolwich, v. R.A.F. College, Cranwell. — This match, played at Cranwell on Nov. 16, resulted in a win for the "Shop" by 3 goals to 2. In previous games, "Shop" had defeated the Old Malvernians, and Cranwell had beaten Christ's, Cambridge; so that a keen game was expected.

Cranwell were without Cleland and Baker, their inside wing forwards, while Woolwich were at full strength.

Play during the first half was very even. Woolwich being very lucky to score through a mistake by the Cranwell left-half. During the second half of the game Cranwell, playing with the wind, pressed continuously, but their attacks lacked vigour. Hogan and Wright

SEE IT FLYING!

THE HERMES-DESOUTTER

3-SEATER SPORTS COUPÉ

The Ideal Light Aeroplane.

SALOON comfort for pilot and two passengers. A cruising speed of 98 m.p.h. Perfect visibility. Practically unstallable. In no other plane but the Desoutter can you get such performance and comfort at the price. It costs very little more to buy, and less to maintain, than an ordinary two-seater light aeroplane, but how much more pleasurable for three to fly—and converse freely—in the comfort of a fully enclosed cabin.

THE Cirrus-Hermes engine has been standardised for the Desoutter Sports Coupé. This, in itself, is sufficient guarantee as regards the reliability of the power plant.

SHORT SPECIFICATION:

Span	36 ft.
Length	27 ft.
Height	7 ft.
Weight	1,070 lbs.
Loaded weight ...	1,800 lbs.
Fuel capacity	21 gallons.
Wheel track	10 ft. 6 ins.
Maximum speed ...	112 m.p.h.
Climb to 4,000 feet with full load (1,800 lbs.) ...	6 mins. 1 sec.

PRICE: With Cirrus-Hermes £795.

DEMONSTRATION FLIGHTS

National Flying Services Ltd. will give demonstration flights with the new Desoutter 3-seater Cabin Monoplane (fitted with Cirrus-Hermes engine) at the London Air Park, Hanworth, on the afternoons of November 22nd, 23rd, and 24th, from 2 p.m. (weather permitting). Those interested are invited to write or telephone for an appointment.

IMMEDIATE DELIVERIES.

¶ **The Desoutter has been adopted by National Flying Services Ltd. as one of their standard types, and they are in a position to offer immediate deliveries.**

Sole Concessionnaires:

NATIONAL FLYING SERVICES LTD.,

played well on the wings, but the reserve inside forwards were weak, and the movements were never finished.

When Woolwich attacked their forwards combined well and they scored twice, through their centre-forward and inside left.

Towards the end of the game Cranwell were awarded a doubtful penalty for hands, which Messenger scored. The play now brightened and just before "no side," Messenger scored again with a clever cross shot.

For the Shop, the goalkeeper played finely, handling the slippery ball in good style. The centre half played a good destructive and constructive game, while left wing combined well and always looked dangerous.

The Cranwell defence was good, and although the forwards tried hard, thy did not work together as a team, and their attacks were easily broken up.

The R.A.F. Squash Racquets Association.

The following officer has taken over the duties of Honorary Secretary and Treasurer of the R.A.F. Squash Racquets Association from Flt. Lt. E. F. Waring, D.F.C.:—Sq. Ldr. J. P. Coleman, A.F.C., A.D.G.B., Royal Air Force, Hillingdon House, Uxbridge, Middlesex.

THE CHRONICLES OF R.101.

On Nov. 12 the R.101 withstood successfully the hardest test that she has yet had. These conditions were probably the most severe that a moored airship has ever successfully withstood.

At 1.15 a.m. the wind veered through 135 deg. from S.W. to N. The average wind speed during this change, which took about a minute, was 35 m.p.h. The indicator at the nose-coupling registered a force of about 15½ tons while the vessel was swinging round the mast.

During the previous day the ship rode successfully through a gale whose average velocity was 55 m.p.h., with a maximum recorded gust of 83 m.p.h.

On Saturday, Nov. 16, the much-advertised Parliamentary flight of the R.101 had to be postponed because of poor visibility and bad weather.

In spite of the various internal disarrangements which R.101 suffered after its last night out, the ship has again been out for the night, and in spite of the cold mornings we now have no airship was to be seen when the crew of the mooring mast poked their heads out for the early morning milk. These nocturnal meanderings, which are prolonged into the next day, can only be regarded as youth's wild oats.

On the morning of Nov. 17 the R.101 left Cardington for the longest flight the ship has so far made. During its wanderings R.101 passed over Howden where R.100 is [A gesture at which we are not amused.—Ed.], over Newcastle, Berwick, Edinburgh, down the Clyde, and then south to Ailsa Craig and so to Belfast.

R.101 returned to the mast at Cardington on the afternoon of Nov. 19 after a flight of 30 hrs. 35 mins.

During the whole trip of over 1,000 miles the airship flew at a height between 1,000 and 1,500 feet. The average speed was about 60 m.p.h.

R.101 IN THE HOUSE.

In the House of Commons, on Nov. 13, in reply to a question by Mr. Malone, the Under-Secretary of State for Air said that the Air Ministry's published programme had from the very first provided for the operation of the Indian airship route with an intermediate halt in Egypt for refuelling. For that reason a mooring tower base had been erected at Ismailia.

Mr. Malone then asked the Under-Secretary of State for Air whether any royalties had been paid in respect of any of the patents held by Sq. Ldr. Scott and Lieut.-Col. Richmond relating to airships; whether any of these patents had been developed by public money; whether the Air Ministry had any control over these patents; and what was the position with regard to the future value of these patents.

Mr. Montague said that no royalties had been paid by the Air Ministry. Some of the inventions covered by the patents had been developed with public money and were embodied in Airship R.101. The Air Ministry had the right of user of these inventions for the service of the Crown in any part of the world free of royalty or other payment and had also certain control over the commercial rights in the inventions under agreements with the inventors. It was not possible to forecast the future value of the patents.

RESTRICTING FLYING.

The Secretary of State for Air is empowered by an Order in Council announced in the *London Gazette* to restrict aircraft movements when it is brought to his notice:—

"That a large number of persons are likely to gather in any district in Great Britain and Northern Ireland for the purpose of witnessing some event of public interest; or that it is intended to hold in any district in Great Britain and Northern Ireland an aircraft race or contest or exhibition of flying."

FRENCH HIGH SPEED.

On Nov. 17 M. Paillard, flying the first of the high-speed aircraft built to the order of the French Government is reported to have made a speed of 310 m.p.h. at Hourtin near Bordeaux.

It is believed that the machine used by M. Paillard was a Nieuport-Delage seaplane (1,000 h.p. Hispano-Suiza engine), which was one of two built by the Company for the 1929 Schneider Trophy Contest. Unfortunately it was not finished in time.

THE FIRST SEADROME.

The construction of the first of Mr. Edward R. Armstrong's Seadromes is to be started next month (December) at Chester, Pennsylvania. The structure should be completed in August next, and will be towed to a position 50 miles south-east of New York, where the floating aerodrome will be anchored for full-scale experiments.

A photograph illustrating a large model which has been tested recently appeared in The Aeroplane of Oct. 30.

Feeling already exists in France that international agreement must be reached as to the partition of the seas of the World for anchorages for seadromes. Otherwise there may be future unpleasantness. In fact, the question of the freedom of the sea appears to be getting mixed up with the seadrome of the free,—if, of course, America is to be considered the Land of the Free.

A MIS-DEAL.

The Italian company Societa Trans-Adriatica has acquired the licence to build the American Burnelli monoplanes by arrangement with the Uppercu-Burnelli Corporation. The agreement calls for the production of not less than 50 aircraft per year for the next five years.

The arrangement was made by Signor Morandi of the Societa Trans-Adriatica, who visited the United States with an Italian Air Commission under General Balbo. The object of Signor Morandi's visit was to examine the various types of American transport aircraft suitable for use on his air lines.

The Burnelli monoplane is of all-metal construction and has a fuselage of aerofoil section 12 ft. wide, with two engines in the nose driving tractor airscrews side-by-side. The cabin, which has accommodation for 20 passengers, is 22 ft. long, 6 ft. high, and 20 ft. wide.

The most recent American-built Burnelli monoplane had two 600 h.p. Curtiss Conqueror twelve-cylinder Vee water-cooled engines, but it is expected that the Italian version will be fitted with either Isotta-Fraschini or Fiat engines.

One American-built Burnelli monoplane will be sent to Italy as a model for the Italian-built machines.

This is claimed to be the first time that building rights for an American aeroplane have been acquired by a European company. [And, unless one's aerodynamic judgment is utterly wrong, it is not likely to encourage similar deals in future. A fuselage of aerofoil form is the least efficient possible form. Also, licences to build Wright aeroplanes were sold to France, Germany, Italy and England more than twenty years ago. And Mr. Fairey bought Curtiss rights six years ago.—C. G. G.]

MOSCOW—NEW YORK.

On Aug. 8, as reported in The Aeroplane of Aug. 14, an A.N.T.-4 monoplane left Moscow in an attempt to reach New York. This machine was crashed at Taiga, near Chita. The crew were unhurt.

A second attempt started on Aug. 23, and was successfully completed on Nov. 1, when *The Land of the Soviets*, as the machine was called, landed at Curtiss Field.

This remarkable flight was made by way of Siberia, the Aleutian Islands, Alaska, and the Pacific Coast of America, and then across the United States to New York.

There is some talk of this machine attempting the Atlantic flight and making a round-the-World trip.

A DISAPPOINTMENT.

The lecture by Senor Don Juan de la Cierva before the Royal Aeronautical Society on "Recent Work on the Autogiro" has been unavoidably postponed from Dec. 5 until the second half of the present session.

M. MAURICE WEISS.

On Nov. 13 M. Maurice Weiss, a well-known French civil pilot, was killed near Garches (Seine-et-Oise) while ferrying a Potez aeroplane from Méaulte, where are situated the Potez works and aerodrome, to Villacoublay. He flew into thick fog when nearing Villacoublay and in flying low to find the aerodrome he hit some trees. He was thrown out of his seat and was killed instantly.

M. Maurice Weiss, who was chief pilot to the Potez company, is not to be confused with Commandant Weiss, the famous French military pilot, who was the father of artillery co-operation and of aerial photography in French Aviation.

DISCUSSING THE SCHNEIDER RULES.

On Nov. 15 the Royal Aeronautical Society held an Informal Dinner (for men only) and Discussion. Members of the Society who also happened for their sins to be members of the Press were requested by the authorities not to report the discussion, on the grounds that many who were prepared to speak had said that if they were certain that what they said would not be reported they would speak much more freely. On the other hand, there was no objection to the use in the Press of information or suggestions given or made at the dinner so long as they were not definitely put down to any particular speaker by name.

In deference to the wishes of the authorities, one has refrained from reporting the discussion in the usual way so that credit might be given to those gentlemen who have delivered themselves of brilliant ideas which do them credit.

At any rate one may say that Colonel the Master of Sempill presided in his usual efficient way.

The discussion meandered, when it ought to have raged, round a motion proposed by a prominent Civil Servant. The wording was: "That this meeting is of the opinion that the present rules for the Schneider Trophy Race and the High Speed Record are not consistent with the proper development of high-speed aircraft."

Obviously the motion itself was wrong because most people would like to alter the High Speed Record rules though they would be content to leave the Schneider Trophy Contest rules just as they are, for the good reason that the rules have been ignored to such an extent that they can be interpreted to mean anything you like.

One does not propose to report each of the speeches individually, but rather to give the general effect.

The Proposer Of The Motion said that our only way of attaining our highest speeds is by seaplanes. [This may be questioned for a start. Unless human ingenuity has ceased to exist we certainly ought to be able to devise some way of getting an aeroplane down unbroken on land even after it has attained the highest possible speed.]

He made the interesting point that every time England has won the Contest the step-up in speed over the previous year has been greater than when any other country has won. He said that high-speed aircraft were already outstepping these islands, for all the forces of land, sea and air had to be marshalled to regulate the Contest. He said that the weather seemed ideal to us but that the Italians thought that the state of the sea during the navigability trials was as severe as would be permissible. The opinion of the pilots of our High Speed Flight on that point would be interesting.

The speaker said that he did not suggest alterations which would alter the types of aircraft. He believed in testing each type to the limit of our knowledge. The rules as they stood needed apparatus of exceeding delicacy. The chief drawbacks to the present rules were our weather and the high cost of producing the machines. We could not do with a wind speed of more than fifteen miles an hour and we had to have an alighting place three or four miles long, and we had to have visibility of not less than six miles.

He said that the navigability tests produced a seaworthy aircraft [which they don't] and should be maintained for that reason. The Contest, he said, ought to be retained to ensure progress, but selecting two days out of the year for it was too risky.

Turning to the subject of the Speed Record he said that the record speed was not representative of true top speeds. Losing height on the way to the starting-point would give an impulse which would last to the end of the course. For example the S.5 had a top speed of less than 300 m.p.h. and it did 319 m.p.h. over the course.

One Of The Wisest Men in aviation, actually, apart from the fact that he makes his living outside of aviation, said that in drafting sporting rules other than technical subjects had to be considered. If we only waited to find out which machine was the quickest the rules for such a competition would be little allied to the present rules. The result would be achieved by technical research and not by a race, but human beings want personal competition. As soon as you start a rating you start a competition to beat the rules.

A race must appeal to the multitude. If the same speed had been achieved in an R.A.E. technical test, even though it might have been chronicled in the press under the biggest capital letters the result so far as the public were concerned would have been nearly a zero with the circle wiped out.

If we merely want to develop better seaplanes, then the machines ought to do a test alighting in mid-Atlantic. Though he feared that he might be a minority of one he expressed the opinion that the existing rules are about the best that can be got.

An Air Ministry Official With A Nice Sense Of Humour said that developing these machines was very wearing, as might be gathered from the fact that there had been four Directors of Technical Development in five years. He said that the record course [of three kilometres with half a kilometre outside each end neutralised] was not nearly enough to stop diving at the start.

Corners on a course did not slow machines as much as might be thought. Assuming the cornering was done at 4G [that is a curve which loaded the machine to four times the force of gravity] the speed round such a course was only 3% less than the speed on the straight, according to Martlesham tests. As regards the efficiency of our aircraft he said that no ordinary machine was more than 30% efficient as compared with the ideal streamline laid down by Professor Melville Jones, but that the 1927 Schneider winner was about 60% efficient.

He gave the interesting information that two members of the High Speed Flight had been detached for research work on the 1929 machines. Such tests, he said, were beneficial to research, but he thought that we had already learned as much in this way as the Government was justified in spending money on.

An Eminent Scientist From Cambridge, eminent for his commonsense quite as much as for his science, said that people who watched the race were not seriously interested in the rules. Yachting rules increased in complexity in the effort to produce more valuable craft. The present Schneider rules had not become more complex. The Schneider Contest itself was not much use for publicity. The only thrill this year was when Mr. Waghorn passed one of the Italians. He believed that a race was only useful as a race when the Competitors could start level and the first man won.

An Official Who Does His Best To Get A Move On Civil Aviation said that we wanted speed, and the Schneider Contest had given it. If it had not been for the Gordon Bennett and Deutsche and Schneider scientists would still be denying the possibility of ever exceeding 200 m.p.h. We had not reached the limit, but he thought scientists themselves were the limit.

He said that all over the world the spirit of hot-stuffing is rampant. Make rules and promptly the best brains try to beat them.

In a competition you must have a gallery as an incentive. Records mean nothing but a race means a lot. The Schneider show at Venice was better than on the Solent because the competitors started at shorter intervals, and there were no thrills on the Solent.

He thought it was up to us to take over the Schneider Contest from the Air Force and keep it going if only to keep our scientists from vegetating.

Another Humorous Official pointed out that the form of the motion was wrong. A race and a record attempt were incompatible and ought to be divorced. Where records only were concerned there was no reason against catapulting the machine off without any undercarriage, and letting the pilot step out with a parachute after he had beaten the record.

He said that this year the speed of our machines had been limited by the rate at which the machines could get rid of waste heat and keep on doing it. The limit of our power unit was our radiator. This looks like a chance for Ethylene-Glycol cooling—commonly known as Prestone—which was invented in this country by Dr. Gibson in 1919 and is now a success in America].

A Well-Known Designer said that the value of Government competition in the Schneider Contest was shown by the fact that before America won in 1923 we took five years to spend as much on research as we now spend in two years. [This is a fallacious argument. Before America came in this country was broke and we had no money to spend.]

Continuing, he said that the racing float of 1927 was the service float of to-day, wing radiators had advanced efficiency, metal airscrews had been developed by racing. He argued that racing had also brought out geared engines which were now used in our fighting machines and commercial machines. We had now produced real streamline wires instead of lenticular wires. We now had aeroplanes which control at over 200 m.p.h. We had got more ahead in six years with racing than in ten without it. He felt that we ought to win the Trophy outright two years hence [Optimist!] and then reconsider the rules.

An Officer Who Has Done Much High-Speed Flying enough to know what he is talking about, said that speaking for others with similar experience he thought it would be a pity to alter the character of the Contest by carrying a load on the machine or increasing the range. He and his friends thought that the greatest risk was in spreading it over two days and being held up by bad weather on one of them.

They wanted to hold the whole contest in one day and so have the chance of postponement. We should never again have two such days as we had on the Solent. The High Speed Flight had waited from dawn to dusk day after day for ten months to get in what little test flying had been possible. The odds were thousands to one against such days in any future year.

He and his friends believed that more than two or three machines on the course at a time would be impossible unless the designers improved visibility and spoilt their performance. [This one believes to be a fallacy. It is probably quite true of existing machines, but one believes that faster machines could be made with perfect visibility.]

He suggested that the machines should be moored out for two hours early on the day of the Contest and that after doing half the course the competitors should come down, alight, navigate between points and then start up again. [This strikes one as being quite a sound idea.]

Continuing he said that the record rules were unsatisfactory. The record would always be won by the pilot who broke the rules by the largest margin and got away with it. He suggested that the approach to the starting-point should be better supervised, and that the level portion of the course should begin five kilometres before the starting-point. He would also cancel the rule about beating the existing record by five kilometres. He thought that photographic timing was accurate enough to justify this.

Another Officer Who Has Done A Great Deal Of Flying said that the last Contest was an attempt to interest the public but it would not interest them again. We ought to try to make the Contest into a real race. This might be done by shortening the time between the starters to thirty seconds and making the designers provide a proper view.

Another Officer With Experience said that any attempt to make a race of it was hopeless. More imagination than the average man possessed was needed to appreciate the fact that the machine was doing 300 m.p.h. Alighting in the middle of such a race would spoil the whole thing. [Would it? Might it not be rather part of the excitement, something like taking the cars round the sand-banks at Brooklands?]

He suggested that the record course ought to be lower because of the difficulty of measuring whether the machine was at 450 ft or not.

An Aeronautical Engineer Of Note said that if more exact rules were imposed people would start fighting the rules instead of fighting Nature. He pointed out that the size of the pilot was now becoming important. He admitted the desirability of thrilling the public and

of making the Contest propaganda for aviation, and also as a means of making money. But he said that if the object of the Contest was simply technical development then— . . .

A Famous Manufacturer Of Aircraft And Engines suggested limiting the size of engines. He said that the existing racing engines were too big, and as good speed could be got out of smaller engines.

An Engineer said that we ought to give the public a thrill without imposing risks and suggested starting all the competitors to fly over a straight line, and then making them do a circuit at the end of the course.

One Of Our Greatest Aircraft Designers said that having had to work to rules himself he regarded them as necessary evils. When the question of fuel consumption arose he could not think why the course was fixed at 230 miles instead of the level 200, and when one of the machines showed signs of sinking near the end of the mooring-out test he could not think why they had to be moored out for six hours instead of five. Nobody, however, thought like that about Air Ministry specifications.

He said that, thinking as an engineer, he believed that the increase in speed in successive competitions must become less, but personally he thought it would not, so he saw no reason why the Contest should stop. He said that fear of the weather conditions was exaggerated. When the pilots had flown the 1927 machines for a couple of years they flew them in all sorts of weather as practice machines. He admitted that the rules were difficult to alter. Alighting speeds could not be fixed.

He said that the lack of thrills on the Solent was due to the breakdown of the Italians. If all the machines had been about equal there would have been thrills enough for everybody. [Here he is absolutely right. If all the machines had gone the whole course at approximately equal speeds all the spectators would have been in a state of nervous prostration until they had heard the results.]

When the motion was put to the meeting approximately thirty-eight voted against altering the rules and twenty in favour of altering them, but nobody seemed quite clear as to why they did not want the rules altered or why they did.

THE GLIDING MOVEMENT.

The First Step.

Mr. Douglas Culver, one of the many gliding enthusiasts who have written to this office, suggests that a lunch be organised at which people interested in gliding can become acquainted, one with another, and start the movement with proper organisation.

Mr. Culver has already written to various people suggesting Wednesday, Dec. 4, as a suitable date. The place would be in the West End and conveniently situated. The lunch would probably cost between 2s. 6d. and 3s. 6d., depending on the number present. The money would be collected at lunch.

So that proper arrangements may be made, will all those able and willing to attend such a function write The Aeroplane, as soon as possible and mark their letters "Gliding Lunch." If there are enough to make up a reasonable lunch-party, further details will apear in The Aeroplane of next week.

Although for obvious reasons not every gliding enthusiast from the outlying counties will be able to come in, there seems a possibility of a good many representative people from such districts coming to Town and airing their views. This would be a good thing, because on their return they could start local organisations in touch with that formed in London.

Below is published the latest list of names to be sent to this office. One gathers that many letters have already been exchanged amongst enthusiasts as a result of the publication of their names in this paper.

There have been so many requests for technical data about gliders that one hopes to obtain some really authentic figures for publication in The Aeroplane at an early date.

Mr. R. F. Dagnall, of the R.F.D. Company, 17, Stoke Road, Guildford, Surrey, says that if some qualified aeroplane designer who is keen on gliding likes to co-operate with him he will be very pleased to build a glider at his own expense. Also he will be glad to build gliders to anybody's designs at the most reasonable possible price.

Mr. Dagnall is primarily a builder of balloons and ballonnets, and of flotation gear for aircraft, but he has well-equipped workshops and has himself had some fifteen years' experience of the building of aircraft.

A number of people have written and stated that they can undertake the building of gliders, so there should be no difficulty about that part of the business. People who are used to aeroplane design are also interested.

One of the pioneer aeroplane builders in this country, a man who before the war made a number of gliding experiments, says that he has surveyed the country south of London and there are plenty of conveniently placed sites in this part of the world. The North Downs, which face the prevailing south-westerly winds, should provide some good spots too.—T. J.

A further list of those who wish to communicate with other gliders is as follows:—

Mr. Horace Wright, 45, Merstow Green, Evesham, Worcs.
Mr. C. H. Latimer Needham, Royal Air Force, Halton, Bucks.
Mr. Herbert Jeffree, 14, Vincent Road, Norwich, Norfolk.
Mr. S. G. Shand, Three Oaks, Pinewood Avenue, Addlestone, Surrey.
Mr. B. S. Whidborne, Lucas and Sons, 21, Surrey Street, Victoria Embankment, W.C.2.
Mr. A. G. Puttnam, 41, Daleview Road, Stamford Hill, N.15.
Mr. C. E. Purves, Chilliswood, Trull, Taunton.
Mr. W. H. Frost, 9, Netherhall Gardens, Hampstead, N.W.3.
Mr. A. L. Haward, Lloyds Building, 3-4, Lime Street, E.C.3.
Mr. R. S. Dickson, 23, Radstock Road, Woolston, Southampton.
Mr. W. D. H. McCullough, 1, Courtfield Road, S.W.7.
Mr. L. F. H. Woolston, Garnes House, The School, Wellingborough.
Mr. E. K. Blyth, 112, Gresham House, Old Broad Street, E.C.2.
Mr. R. E. Brook, Carlton Dene, Ewell, Surrey.
Mr. R. G. Cazalet, Hillcrest, Whittlesford, Cambridge.

An Australian Gliding Venture.

A Gliding Club, the first in Australia, has been formed at Geelong. This town is some forty miles S.W. of Melbourne, and is situated on an extension of Port Philip, the enormous natural harbour on which Melbourne is built.

A number of enthusiasts have formed this new Club and have had a training glider built by the Aircraft Manufacturing Co., Ltd. This glider is of the high-wing type made familiar by the Germans and since imported into America.

The monoplane wing is carried on the top of a very deep and narrow girder framework, to the bottom of which is fixed a forwardly projecting skid. This girder extends aft and supports a monoplane tail unit. The pilot sits in front of the wing. His back is against the front post of the girder, and he sits on the skid. He has the usual stick and rudder-bar controls.

The Geelong glider was tested on the local aerodrome by towing behind a car, after which the machine was taken to some rising ground in the neighbourhood of the town.

Here a large number of flights were made. The machine was launched by towing, a motor-truck pulling the glider up one side of a hill so that the machine could glide over the crest and down the other side. The longest flight lasted for about two minutes, the type of glider used did not permit of very long flights.

After some more practice, the Gliding Club hope to go farther afield and find a suitable terrain for catapult launching in the approved fashion, with a rubber tow-rope.

The Gliding Club intend to raise enough money by public subscription to buy first an advanced training glider and then a super-streamline "sailplane," such as the Germans use for their long-distance glides of over 100 miles.

Why Glide?

There is a tendency nowadays to de-strenuate sport, or, at any rate, to suit it to lazy men. People do not learn to sail boats, for that is difficult. Instead they buy outboard motors or something similar. Gliding is attractive to the true sportsman because there is no power-plant to pull one through difficulties, and one has to learn to get by sheer skill the best results from up-currents as one finds them.

The sport is not expensive, and if a suitable terrain is available, should be a means of enabling many who could otherwise not afford the luxury, to take to the air and learn to fly.

In view of the way gulls find places all over the downs and Scottish hills where they can indulge for hours in soaring flight, one has often wondered whether gliding would not be possible in this country, although the interest aroused at Itford soon disappeared.

HINTS TO HOLIDAY MAKERS IN N. AFRICA.

Some people favoured by good fortune can go holiday-making along the North African coast. Those who go by air are advised to read Air Ministry Notice to Airmen No. 68 of the year 1929, which advises as follows:—

1. Pilots should, on alighting, notify the last place of departure by telegraph. The next objective should also be notified by telegraph when the flight is to be continued. The telegrams should invariably be addressed to the Officer Commanding the air station or to the British Consul at the place concerned, and not solely to a petrol company's representative or other local agent.

2. Telegrams to the next objective should be despatched the night preceding departure, as delays frequently occur in the transmission of the messages. These telegrams should state the registration marks of the aircraft, the name of the pilot, and the anticipated date and time of arrival.

3. In the case of Benghazi or similar places where hotel accommodation is limited, the telegrams should include details as to the number of persons requiring accommodation and the proposed duration of the visit. Telegrams to H.M. Consul, Benghazi, should be prefixed with the word "Notte" and sent *via* Syracuse to avoid delay.

4. Owing to unsettled tribal conditions in certain territories in North Africa, pilots are advised to fly along the coast, as a forced landing inland might be attended by considerable danger.

FLIGHTS TO EGYPT.

Flying to Egypt, or through it, is no easy matter, and private owners are reminded that the Egyptian Government requires 15 days' notice of such flights. As the Air Ministry requires six weeks to obtain permission from the Egyptian Government for such flights, intending visitors by air are warned to make their arrangements well in advance. They should at any rate read Air Ministry Notice to Airmen No. 67 of the year 1929.

THE LIGHT AEROPLANE
AND THE FLYING CLUBS.

THE CLUB NOTES.

eader of THE AEROPLANE writes criticising the policy of AEROPLANE in dropping the Club Notes. He says:—

e fully realising that a few were taking unfair advantage in ıg your valuable space to immortalise the adventures of a cer- ımbrella, there were on the other hand a number of Clubs ıt, I believe, a majority) who were sending in for publication e and sane reports of their weekly activities, which I believe read by many; or were, at the time of their discontinuance, just ıg an atmosphere of healthy competition and to my certain edge were providing a number of Club Secretaries and officials valuable data for analysis, with reference to such points as the ıum and average flying hours practicable under varying con- s and with varying numbers of machines, and surely the en- sm and position of the admittedly small number who did make analyses, justified their continuance.

n aware that some time back, you promised the publication of interesting facts that Clubs might care to send along, but gh perhaps unintentional I must say that the general attitude st persons concerned on reading your remarks, was to believe he less you heard from them the better you were pleased. I is only as the outcome of some seven or eight conversations with officials whom I have had the pleasure of meeting during s excursions around the country in my machine.

r careful analysis of the apparent policy of THE AEROPLANE I ally believe that nothing is farther from your idea, and it is ore on this account that I, a humble and inexperienced "A" pilot, venture to criticise one who has been in the game the start, and who by pursuing an outspoken policy has done so to foster it. Again on all sides I hear universal regret ex- d that Club reports now appear so rarely.

e reason the Clubs' Reports have been cut out is that y any of them had either the enterprise or the intel- ce ever to send anything which was of practical value e progress of aviation. The space which they took up purely local gossip and alleged jokes is now available ıews of general interest, except when an enterprising happens to send in some useful information, such as the ıe Ports Club seems to send more frequently than any . The Secretaries are not to blame, for many of them said that they cannot get useful or interesting material either the pilots or the ground staffs.

ıen once a sort of general standard of Club flying, ıured in hours per week and per machine, had been ılished there was no particular object in wasting space ding each week how much each Club flew. If Club etaries want to know such figures they ought to estab- a kind of clearing house at the Royal Aero Club, which ıt to issue a typewritten list to all the Club Secretaries week saying what each Club has done in the previous . And anyhow the figures are not worth much be- e they are affected more by weather than by efficiency. nally, the subsidised Clubs have much less influence ıese days on the progress of British aviation than they a year or two ago. The Clubs do not buy anything like nany machines as are bought and used by private ers and by proprietary schools, and the members do not ridually do as much flying as do the private owners.

far as making History is concerned the Club movement decreasing force, though the Clubs themselves may go ndefinitely as purely social affairs, or until they are ac- ed by commercial concerns.—C. G. G.

N.F.S. CLUB NEWS.

ıere are now over 600 members of the Flying Club at ıworth. Since its opening on Aug. 31, 145 have begun ruction, and 35 have taken their "A" licences.

uring the eleven weeks since the opening of the Club, flying time has amounted to 1,446 hours.

he Hull Aero Club, which is one of the N.F.S. subsidi- s, had a total of 87 flying hours in its first month from . 11. The Nottingham Club, another subsidiary, flew ıours in September and 45 in October.

nother N.F.S. subsidiary, the Berks, Bucks, and Oxon oplane Club, started active flying on Sept. 23, and by . 12 had flown 111 hours.

he Yorkshire Aeroplane Club, which joined N.F.S. on . 15, had flown 80 hours by Nov. 15.

ational Flying Services now have 25 aircraft in com- ssion, and this number will be shortly increased by the ıvery of the Desoutter "Sports Coupé," the first of which l be demonstrated at Hanworth on Nov. 22, 23, and 24.

LONDON—CAPE TOWN.

On Nov. 18, Mr. Roy Tuckett, who is attempting to fly the Cape in a D.H. Gipsy-Moth, arrived at Alexandria.

He left Athens at 06.45 hrs. to cross the Mediterranean when midway across an oil pipe split. He succeeded in ıching the African coast and after making temporary re- rs and filling up with a spare can of oil which he carried reached Alexandria at 18.00 hrs.

A more permanent repair is being made at Alexandria.

SIR CHARLES THE MUNIFICENT.

Sir Charles Wakefield has presented a Gipsy-Moth to the Aero Club of East Africa.

This is the seventh Moth which has been presented by Sir Charles to various Aero Clubs throughout the Empire.

His first presentation was to the Lancashire Aero Club in 1925. His other presentations have been to Major-General J. H. McBrien, President of the Aviation League of Canada; the Delhi Flying Club (India); the Singapore Flying Club; the Johannesburg Light Plane Club (South Africa), and the Lyttleton Flying Club (New Zealand).

The machines presented to the Singapore and Lyttleton Clubs were seaplanes.

A REGISTER OF CIVILIAN AIRCRAFT.

[*A Register of Civilian Aircraft.* Compiled by R. L. Preston (Hon. Sec. of the Household Brigade Flying Club). Obtained through Flying Clubs or direct from the Secretary, The Household Brigade Flying Club, Heston Air Park, Hounslow, or from THE AEROPLANE Book Dept., Cannon House, Pilgrim Street, London, E.C.4. Price 2s. 9d., post free.]

This little publication has been produced to help pilots and others to recognise the ownership of aircraft both in the air and on the ground. To arrange such a book so as to make the search for any one particular registration a matter of a few seconds, is not easy. The compiler has tackled this by allotting a page to each group of lettering which only involves the change of one letter—for example, G-AAAA to G-AAAZ, G-AABA to G-AABZ, etc. The book is arranged alphabetically so that aircraft lettered from G-AAAA to G-AARZ precede those lettered from G-EAAA to G-EBZZ.

Chronologically this should be round the other way, as G-EAAA was the first machine to be registered in this country and the introduction of the new registration G-AAAA is of comparatively recent origin. However, this is quite a minor point and except for a disrespect for the divine right of age matters but little.

The real difficulty with a book of this type is the fact that it so soon becomes out of date owing to changes of ownership, crashes, etc. The compiler recognises this fact and states that amendments will be issued every three months. The copy under review allows for the ready insertion of amendment sheets as it is arranged for a loose-leaf binding.

At the end of the book is given the list of registration lettering recently allotted to Great Britain, the Dominions, British Colonies and Dependencies. This is interesting in showing that such possessions as St. Helena, Weihelwei, the Leeward Islands, Trinidad and Tobago, to mention a few, have not been ignored as the ultimate proud owners of domestic aircraft.

Unfortunately this list, which includes names of Colonies and Dependencies which may never have their own registered aircraft, is followed by a very incomplete and inaccurate list of the registration letters of only nine foreign countries. Except for this and a few minor spelling errors, the register will be of considerable interest and value to those who want to know the breed and ownership of British Civil Aircraft.

THE MOTH IN COLOMBIA.

The Sociedad Colombo-Alemana de Transportes Aereos (Scadta), which company has been operating a very successful air mail service in Colombia, South America, since 1919, has recently acquired two Gipsy-Moths to supplement its regular fleet of Junkers monoplanes.

One of these Moths with a load of mail has been flown from Buenaventura to Bogota over the Andes. This flight was an experiment to determine the suitability of the Gipsy-Moth for such service over difficult country. The crossing of the Andes was successful and uneventful and the Scadta now intend to establish feeder mail-routes with Gipsy-Moths to connect with their main routes.

The two Moths were supplied to the Scadta by Herr Alfred Friedrich, the D.H. German representative, who has established a Moth Service Station at the Tempelhof Aerodrome, Berlin, for the convenience of Moth owners in, or visitors to, Germany.

THE WRONG WAY.

Some members of the advertising trade have queer ideas about what is good advertising. During the last few days a number of photographs and paragraphs have arrived in this office either illustrating or recording the fact that an American prize-fighter has flown in some British aeroplanes.

Surely British Aviation has not come to such a pass that it need depend for editorial notice on the fact that a British aeroplane with a British engine has taken into the air an American prize-fighter whose head was about to be punched by an Italian?

COMMERCIAL AERONAUTICS.

THE NEW WESTLAND FOUR.

Westland IV three-engined cabin monoplane was the hree-engined light cabin monoplane to be produced in ountry. It was designed to fulfil the requirements of perator who has insufficient traffic for big multi-ed aircraft but who needs a small four- or five-passen-eroplane which has the added security of the multi-ed type.

first Westland IV monoplane made its first public rance in February of this year, and this machine was tted to a long series of practical tests. As the result ese tests certain modifications suggested themselves, hese were incorporated in the design. The modified ine was exhibited at the Aero Show at Olympia in This machine was actually one that had been bought ıperial Airways Ltd. for use by their private charter tment in place of small single-engined aircraft.

s latest version of the Westland IV has three Cirrus-es engines in place of the Cirrus III engines. The ng of these engines has been improved and the new has been found to reduce the drag appreciably. In machines the nacelles will be made even narrower f a better streamline form.

present undercarriage is of the oleo-pneumatic type he complete oleo leg and vertical torque-rod are now ed in streamline fairing. The mudguards are of a nline section which reduces their drag and does not ere with efficient use as mudguards.

controls are throughout of the push-and-pull type, all bearing surfaces are made extra large to reduce as much as possible. The fairing under the fuselage, previously enclosed the controls where they passed the cabin, has now been removed. Besides facilitat-maintenance, this modification improves the aero-mic section of the fuselage.

the convenience of the pilot a rear mirror is mounted the front of the pilot's cockpit so that he can see wards over the wing. This enables him to see whether ail-controls are operating and also to see whether thing is clear behind the machine not only on the nd but also in the air before he attempts to take off. is a very important feature for enclosed cabin air-where the pilot's view is often limited to a forward tion only.

rge boiler-type petrol gauges are fitted in front of the fuel-tanks on the leading edges of the main plane, re they are in full view of the pilot.

The Williamson Manufacturing Co. Ltd., the makers of the "Eagle" aircraft camera, have inspected the Westland IV, and they have advised the Westland Aircraft Works Ltd. that the machine is admirably adapted for Air Survey work and for the installation of an "Eagle" camera. In their words: "It could not be better suited if it had been specially built for such work."

In addition to one sold to Imperial Airways Ltd. the Westland company has sold a Westland IV to Wilson Air Lines Ltd. of Nairobi, and another to the Shell Co. of Australia Ltd.

Imperial Airways Ltd. has taken delivery of their machine. The other two will shortly be flown to their destinations, the former to Nairobi by Flt. Lt. F. A. Swoffer and the latter to Melbourne by Mr. E. J. Jones, M.C., D.F.C., formerly Australian Deputy Controller of Civil Aviation, and Mr. H. C. Owen.

The Westland IV has passed its Martlesham tests for a certificate of airworthiness, and the following data concerning dimensions, weights, and performance are based on the official Air Ministry Tests:—

DIMENSIONS.—Span 57 ft. 6 in. (17.5 m.), Length 37 ft. 6 in. (11.4 m.), Height 9 ft. 6 in. (2.9 m.), Chord 9 ft. 6 in. (2.9 m.), Wheel track 15 ft. (4.56 m.), Wing area 490 sq. ft. (45.5 sq. m.), Volume of cabin 108 cub. ft. (3.05 cub. m.), Volume of luggage lockers 42 cub. ft. (1.19 cub. m.).

WEIGHTS AND LOADINGS.—Weight empty 3,476 lbs. (1,574 kgs.), Fuel and oil 830 lbs. (376 kgs.), Pilot 180 lbs. (82 kgs.), Pay load (passenger machine) 1,098 lbs. (497 kgs.), Pay load (freight machine) 1,190 lbs. (540 kgs.), Weight loaded 5,750 lbs. (2,605 kgs.), Wing loading 11.7 lbs./sq. ft. (57.1 kgs./sq. m.), Power loading 18.3 lbs./h.p. (8.3 kgs./h.p.).

PERFORMANCE.—Speed, maximum, 110 m.p.h. (177 km.p.h.), Cruising speed 95 m.p.h. (153 km.p.h.), Initial rate of climb 530 ft./min. 162 m./min.), Service ceiling 10,000 ft. (3,050 m.), Absolute ceiling 12,300 ft. (3,750 m.), Maximum height maintained on two engines 2,000 ft. (610 m.), Range (full fuel) 5½ hrs. or 520 miles (838 kms.).

AIR MAILS FOR PERSIA.

The Postmaster-General draws attention to the fact that a considerable proportion of the correspondence posted for transmission to Persia by the Indian Air Mail is being posted insufficiently stamped. The air fee for all correspondence for destinations in Persia is now 5d. per half-ounce in addition to the ordinary foreign postage. This fee covers air transmission from London by the direct Indian Air Mail to Baghdad or Bushire and thence by air into and within Persia as necessary.

THE WESTLAND IV.—A view of the nose of the Westland IV which has been bought by Imperial Airways for use by their Private Charter Department. It has three 105 h.p. Cirrus-Hermes engines and accommodation for four passengers and a crew of two.

THE FIRST AVRO FIVE IN KENYA.

The Avro Five with three Armstrong Siddeley Genet Major engines, in which Mr. Campbell Black left Croydon on Oct. 24, arrived at Nairobi on Nov. 11. This machine, which was named *Knight of the Grail*, and of which photographs appeared in THE AEROPLANE of Oct. 23, has been bought by Wilson Air Lines, Ltd. A second machine of the same type has been ordered by the same company.

N.F.S. IN BRITISH EAST AFRICA.

As reported in THE AEROPLANE of Oct. 9, an N.F.S. contingent which consisted of Sq. Ldr. the Rt. Hon. F. E. Guest, C.B.E., D.S.O., Miss W. E. Spooner, Flt. Lt. R. C. Preston, A.F.C. (R.A.F. Special Reserve), and Mr. E. G. Hordern, R.A.F., left this country recently for East Africa.

The expedition, which was organised to investigate the possibilities of commercial aviation in East Africa, duly arrived in Nairobi and made its initial survey arrangements. It has now been divided into three parts.

One has gone to Rhodesia to discuss with the Northern and Southern Governments of that country the possibilities of linking up their territories with the main air route.

Another part, which includes Sq. Ldr. Guest himself, has gone to Dar-es-Salaam to discuss with Sir Donald Cameron, the Governor, the provision of feeder services in Tanganyika.

Miss Spooner has flown to Uganda for a similar purpose.

NEW YORK—HAVANA IN 37 HOURS.

Pan-American Airways Inc. and the railway companies have completed arrangements which bring Havana within 37 hours of New York.

As an express already runs between Boston and Miami, the only alteration needed to make this journey possible was the addition of a special New York coach to the express and air transport from Miami to Havana. This last stage is flown by Pan-American machines.

3,000 MILES IN 36 HOURS.

Arrangements are being made by the Aviation Corporation, one of the big aviation amalgamations in the United States, to operate a 36-hour passenger service between New York and Los Angeles.

One of the subsidiary companies of the Aviation Corporation will operate the line from New York to Kansas City. From Kansas City to Los Angeles the journey will be made by Western Air Express, who have been operating this section of the route for several months.

The first stage of 11 hours will be made to Kansas City. Here passengers will stay overnight, continuing the 13-hour stage to Los Angeles the following day.

Stops will be made at Cleveland and Chicago on the first stage, with further stops at Wichita, Amarillo (Texas), Albuquerque (New Mexico), Holbrook (Ariz.), and Kingman (Ariz.).

The machines used will be three-engined Fokkers.

AIR TRANSPORT PROGRESS IN SWEDEN.

The Swedish Aerotransport Company, whose managing director is Captain C. Florman, have operated their air lines regularly and successfully for six years without injury to any passenger.

This company announces a big increase of mail transport business. 59,400 kgs. (131,000 lbs. or 58½ tons) have been carried this year as against 38,800 kgs. (85,600 lbs. or 38½ tons) for 1928. [One finds this last sentence a little vague. 1929 is not yet complete, so either the figures are partly estimated, or are only up to a certain date in this year.—ED.]

The number of passengers on the Stockholm-Helsingfors route have increased by 70 per cent. this year.

One would gather from these figures that the Swedish Aerotransport Company, like most other air transport concerns, finds that mail transport is the most paying proposition.

DORNIERS IN THE UNITED STATES.

The General Motors Corporation and its subsidiary the Fokker Aircraft Corporation of America have announced the formation of the Dornier Corporation of America, to be incorporated in Wilmington, Delaware. Dr. Maurice Dornier is now in the United States helping in the organisation of the company. This corporation will manufacture flying boats under Dornier licence.

With the production of Dornier flying-boats in America, General Motors now have a field for the development of sea-going aircraft in addition to land-going aircraft of the Fokker type.

This is the eighth expansion of General Motors during the year which is concerned with the development of aeronautics.

The General Motors Radio Corporation, in conjunction with General Electric, Westinghouse, and the Radio Corporation of America, is said to be developing radio sets for aircraft use.

ARGENTINA TO ENGLAND.

A correspondent sends the envelope of a letter which was delivered in London on Nov. 14 after having left Buenos Aires on Nov. 2, which is about nine days' faster than the time of the fastest ship. The letter had come by the air line run by the Latecoère company.

This line starts from Santiago de Chile, crosses the Andes to Buenos Aires, runs up the east coast of South America flying largely by night over properly lit aerodromes, to Porto Natal in Brazil. Thence the mail is carried by Messageries Maritimes steamers to Dakar in West Africa. Thence it is flown by land aeroplanes to Paris and thence the letters are brought by ordinary post to London.

That is to say, by using a French air-mail line the English merchant can save nine days out of twenty-one in any direction on his business correspondence. The point here is that the amount of mail between England and South America is four or five times as great every week as is the amount of mail between England and India.

Consequently if we consider our air mail lines purely as a commercial proposition and do not regard our Indian mail line in the light of a strategic railway it would pay us very much better to run an air-mail line of our own to Buenos Aires than it does to India. In fact the mass of business done between England and South America would fully justify the starting of an air mail line on that route purely as a commercial concern if the co-operation of the Post Office could be assured.

As an example of how other countries do things this correspondent points out that the envelope, which bears the name of the Compagnie Générale Aéropostale and the Aeroposta Argentina, S.A., is a free issue by this company—which company also supplies the public with notepaper free of charge. This notepaper is of specially light weight and of very good quality, and, curiously enough, it is made in England.

The extraordinary thing, which is also a trifle humiliating, is that we should have to have an example of this kind set us by a country like Argentina which has a mixed population of less than 10,000,000 persons.

GERMAN AIR-MAIL ENTERPRISE.

On Oct. 25 Herren von Schroder, Albrecht, and Eichentopf in an Arado V-1 commercial cabin monoplane (525 h.p. B.M.W. Hornet engine) belonging to the Deutsche Luft Hansa, left Berlin at 03.25 hours, and after 10¾ hours' flying arrived at Constantinople. On Oct. 29 they left Constantinople at 02.25 hours and arrived back at Berlin after a 10¼-hour flight.

The same crew in the same machine had on Sept. 14 flown from Berlin to Seville and back in 29¼ hours flying time, with an intermediate stop at Marignane.

The same crew also made the first experimental flights for the Deutsche Luft Hansa to Vladivostock and the Far East last year in a Junkers monoplane.

Herr von Schroder, who is one of the pilots, is also a Director of the Luft Hansa.

These experimental flights are being made to examine the possibilities of high-speed mail carrying, which aspect of air transport has been interesting the directorate of the Luft Hansa for some considerable time. The company last year established two routes, one from Berlin to London by way of Hannover, Essen, and Cologne, and the other from Stralsund to Stockholm solely for mail and light freight.

The reduction in the subsidy to the Luft Hansa this year has resulted in the company reducing its network of small cross-country air routes in Germany, many of which, partly subsidised by towns or states, have previously been run at a loss. Instead, the company announced that it would concentrate on the establishment of a certain number of purely air mail routes in addition to its already more soundly established passenger routes.

These experimental flights with the Arado monoplane are of interest in showing the possible expansion of Luft Hansa. The experimental flight to Seville was in connection with the projected route to South America for which the Rohrbach Romar flying-boat has been bought by Luft Hansa for the operation of the marine section of the route from Spain to South America by way of the Azores.

REIGATE PROTESTS.

The Daily Telegraph for Nov. 11 stated that the Mayor of Reigate (Mr. Temple Newall) on Saturday protested strongly against the low flying of air liners.

He declared that in cloudy or misty weather this involved very low flying over Reigate. Recently two 'planes had circled over the Earlswood district, only occasionally visible and apparently invisible to each other.

"This is a very serious matter in view of the recent tragedy," he added, "and constitutes a grave danger, not only to passengers in air liners, but to the inhabitants of the borough. The matter will be brought before the appropriate committee, for I feel that a strong protest should be made."

CROYDON NOTES.

For the past ten years, those of us who have spent Armistice Day each year at Croydon Aerodrome have found the two minutes' silence less impressive and less inspiring than it ought to be. We have never had more in the way of organisation than a couple of maroons, the first of which has almost invariably caught us in the most awkward positions and places.

We have been suddenly paralysed whilst buying a penny stamp or whilst attempting to obtain a packet of cigarettes from a refractory machine, and we have stood uncomfortably to attention on the tarmac, or half-way upstairs. One year an unfortunate individual was frozen to immobility for two minutes on a small iron ladder, half-way up the old neon beacon in an icy wind, and naturally nearly died of exposure. This sort of thing could so easily be avoided with a little organisation.

In London human organisation has gone far towards the production of an annual miracle. Man-made or not, the sudden stillness and silence that descends upon that tumultuous city is very like the Peace of God, which passeth all understanding. Under such conditions, even the worst of us come very near to the sort of prayer that matters. Two minutes of such a mental condition every year is bound to be good for us all.

With a large population such as we now have at Croydon, a suitably reverential and impressive ceremony could very easily be arranged on the lines of the following letter received from one of the Heads of Departments of an Air Line here at Croydon.

I do not know how you feel about it, but it seems to me that the two minutes' silence on Armistice Day in an office is a very awkward period, and I certainly must say that I miss a service which I attended for seven or eight years, which was held on the Baltic Exchange, of which body I was a member.

The main Hall of this building is very suitable for a short service of this kind, and I do feel that the centre of Civil Aviation should officially recognise this service.

On the Baltic we used to borrow two or three trumpeters, which we placed in a gallery who sounded the Last Post and the Reveille. The service generally consisted of a hymn followed by an address by the Bishop of Willesden.

I am sure some local Clergyman would be only too pleased to officiate in a similar capacity.

I am giving this suggestion for what it is worth, feeling that you have possibly similar ideas on the subject as myself.

It only remains to be said that such simple organisation as is necessary should be undertaken by the Chief Aerodrome Officer, and to suggest that a local clergyman who would be very pleased to officiate would be the Rev. Donald Robins, who is an old friend of many of us. He is an ex-air-line pilot, and is the ideal man to invite for November the eleventh, next year.

Once upon a time the environs of Fleet Street were known as Alsatia, where the worst rogues, crop-eared pick-locks, cut-purses, gallows-birds and scoundrels of the Kingdom had their haunt. Just as the grey rat from Norway, being the more unscrupulous rodent, was able to drive the black rat from the sewers of London, so Journalism ousted the simple-minded cut-throats from Alsatia and reigned in their stead.

Truth was said to reside (precariously no doubt) in the bowels of a well connected with the Fleet Ditch, but the first act of Journalism was to brick up that unfortunate lady and build a Printing House on the site of the well. After that they went about their business with a clear conscience.

The Devil chuckled when he saw the Journalists take their place next door to the Lawyers, but he simply howled with mirth when the B.B.C. came to Savoy Hill all nice and handy, and since subterranean mirth must have a vent the gas and water mains in Holborn were disrupted and paving stones flew about, which is a mere matter of history.

The above is merely a prelude to the fact that one of the Daily Papers has gone ga-ga on Aviation matters lately, and on possible and impossible occasions, has burst forth into a pimply eruption of scare headlines containing such gems as "dire peril," "unparalleled escape" and "thrilling adventure" all applied to aircraft or airships which were mostly quietly pursuing their lawful occasions.

The paper in question has recently led its public to believe that an aeroplane landing at Lympne on a windy day, did so on one wing tip, which it then proceeded to drag along the ground for some distance. After this, the aeroplane flew to Croydon *undamaged*.

Another comic paper story was that a machine had "crashed" scattering a large crowd, but was found to be quite O.K. to continue its journey next day.

This particular story the paper had to contradict with humility the following morning. Like the dog in the Bible however, some people rather enjoy eating their own words.

Incidentally, one particular newspaper has a so-called correspondent at Lympne who is a first-class liar—an example of a grave-yard ghoul thinly disguised as an imitation human being with bubonic plague and mental leprosy. He is asking for a bath in the local horse-pond and a smart rub down after it with tar and feathers. He thinks nobody knows who he is, but his anonymity is rather rapidly wearing thin. *Verb. Sap.*

Wandering Troubadours in Argosies and W.10's are infesting the Near East at present. One of them, well known at Croydon for having the gift of tongues pretty highly developed, is said to have impressed the natives at Athens when he descended amongst them from on high, with a slight bump, by remarking, "*Oi, Polloi! Where's the pub-opolis?*"

The Near East is now uncertain whether to collar this pilot as a souvenir and keep him in the local museum in a bottle, or to regard him as a mixture of messiah and mad mullah and start a Holy War about him. At present they are temporising by paying him divine honours, served in a quart mug.

Services have been considerably interrupted by fog and bad weather lately. Friday, the 15th, was one of those days when Croydon was enveloped in fog all the morning whilst the sun shone at Biggin Hill, and a number of services were cancelled. Saturday was a much worse day and only one little Golden Ray pierced the gloom,—outward bound at any rate.

Sunday was not so bad, but thick fog enshrouded Croydon all the morning on Monday. First away from Croydon on Monday morning by several hours was the K.L.M. machine which flew in perfectly good weather above the fog at about 1,000 ft. or so, and got through quite happily. Croydon be-

SARO 1830

SARO "CUTTY SARK"

CABIN FLYING BOAT.

THE Cutty Sark is designed as a cabin flying-boat suitable in every respect for commercial air-routes, private ownership, fire patrol, etc., but is readily convertible to amphibian principles.

Equipped with one, two, or three engines, the smaller model accommodates 4 cabin passengers, the larger type seating eight people. The twin or triple-engined machines fly level even with one unit out of action.

Every auxiliary is likewise produced by Saunders-Roe, the range embracing refuelling tenders, petrol and oil scows, amphibian gear, floating docks, and general servicing units.

haved alarmingly in the afternoon of Monday, when large solid chunks of white fog drifted across the Aerodrome and then completely faded away. One minute there was excellent visibility and the next moment about one yard.

The sort of fog, tempest, rain and frost we have had recently takes about a million years to destroy a mountain by erosion. Not so with our Terminal Block, which will probably be gone in another three weeks or so of bad weather. Not long ago the Meteorological Office had the day's rainfall come into the office and measure itself before their eyes and several Customs Officers have taken free baths up to the ankles when they opened their door in the morning.

All the roofs, walls, doors and windows let in rain and wind, and we expect springs to bubble up through the flooring at any moment. The Authorities say its quite all right and that the building is merely settling on its foundations. This is just what we feared, and there is nothing we dislike so much as working in an office where the roof touches the floor.—SPRY.

CELLON DOPE.

Although the new works of Cellon Ltd. at Ham are not yet fully in operation, two output records have been broken during the past two months.

In September, when the firm had not started to manufacture at the Ham Works, they were called upon to deliver the largest amount of dope since the end of the War.

In October, the first month in which a portion of the new works was operating, they had the largest output of "Cerric" Lacquers in the history of the company.

For the first four months of the present financial year, the dope output was far in excess of any previous year, from which it would appear that apart from the aircraft industry having absorbed larger quantities of Cellon dope, the demand has also increased in other directions. So far only one Mixing Shop is working at Ham and the old Mixing Shop at Richmond is still working at full capacity.

Mr. A. J. A. Wallace Barr, who is the founder of the firm, who is also the moving spirit, is to be congratulated on this new business success.—G. D.

COMPANIES INCORPORATED OUTSIDE THE UNITED KINGDOM.

COMPAGNIE GENERALE AEROPOSTALE.—Particulars of Compagnie Generale Aeropostale were filed on Oct. 25, pursuant to Section [illegible] of the Companies (Consolidation) Act. The capital is Fcs. [illegible] in 40,000 shares of Fcs. 500 each. The company was incorporated in France, to carry on commercial and industrial business relating to the manufacture, purchase and sale of aeronautical material; to create and exploit any lines of aerial navigation, etc. The registered office is at 92, Avenue des Champs-Elysees, Paris. The British address is at 52, Haymarket, S.W.1, where E. P. Grosfils, London Manager of the Air Union, is authorised to accept service of process and notices on behalf of the company. The directors are: M. Boulloux-Lafont, M. Boulloux-Lafont, The Marquis Beppo de Massimi, R. de Burlet, O. P. Dhe, R. Fould, P. G. Latecoere, A. Lazard and Marquis Thibaud de Solages, all of Paris; A. Fortoul of Neuilly; J. Praissman of Marseilles; M. Portait of Santiago; and Count Emmanuel de Sieyes of Buenos Aires.

SITUATIONS VACANT.

Aircraft Draughtsmen required immediately. Write, s ing age, experience and salary required, to **Handley P** Ltd., Cricklewood, N.W.2.

Draughtsman, senior aeronautical, required. Apply letter only. The De Havilland Aircraft Co. Ltd., Stag L Aerodrome, Edgware, Middlesex.

First-class Aeronautical Draughtsmen.—Five required mediately. London Ditsrict. Box No. 5739, THE AEROPL Cannon House, Pilgrim Street, E.C.4.

SITUATIONS WANTED.

Experienced "B" Licence Pilot is available in ei temporary or permanent capacity for Air Taxi demons tion or similar work. Aged 28: Public School: 1,200 ho flying on all types, including twins, two-seaters, si seaters and seaplanes. Instructor at C.F.S. A.1. Cate Ground job of permanent nature with possible finan interest would be considered.—Write in first place to E No. 5733, THE AEROPLANE, Cannon House, Pilgrim Str E.C.4.

Ground Engineer, A, B, C and D, seeks permanent p tion. Sound production and maintenance experience. G references. Box No. 5737, THE AEROPLANE, Cannon Ho Pilgrim Street, E.C.4.

Public School Boy seeks progressive position abroad wh aircraft communications are being developed, preferably Colonies. Keen, Pilot's "A" Licence, slight business e perience. Box No. 5741, THE AEROPLANE, Cannon Ho Pilgrim Street, E.C.4.

TUITION.

We offer sound Instruction in Aeroplane Design, Fittin and Rigging, and Aero-Engine Fitting and Rigging; also ex pert training for Ground Engineers (Categories A, B and D). All tuition is by correspondence. Write to-day fo our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings Kingsway, W.C.2.

WANTED.

"All the World's Aircraft," for years 1914, 1924, 1926. W pay good price. W. W. Constantine, 111, Grosvenor Roa S.W.1.

MOTHS AND MONEY.

A second-hand MOTH bought from Brooklands is a sound investment. While you have it you are provided with service by the School's expert maintenance staff. After you have finished with it they will buy it back from you with a reasonable deduction for depreciation, or will make the best allowance on the purchase of another machine.

All MOTHS acquired are promptly put into the shops for reconditioning. The work is carried out by certified men of unequalled experience, and the machines are tested by pilots who know them inside out. They are then sent forth with their blessing and certificates of airworthiness.

Your MOTH is at Brooklands, waiting for you to collect; second-hand from £375; new from £675. You need not pay outright: hire purchase terms enable you to PAY AS YOU FLY. If you buy a new Moth from the School you can get special terms for the most expert instruction available.

ON VARIOUS THINGS.

One of the most curious things about running a newspaper, and one of its charms, is the fact that quite unconsiderable, if not unconsidered, words or phrases which are published in any issue are apt to bring forth protest or commendation from readers, with the result that a day or so after a paper has been published the Editor's postbag partakes of the nature of a "Lucky Dip" with all its attendant charm. So let us discuss some of the things which have come in this week.

THE CLUB QUESTION.

Last week one happened to remark that the Flying Clubs are not quite so important as some people seem to think they are. This, together with a suggestion that the influence of the Flying Clubs is somewhat on the wane, has produced indignant protest from two such important persons as Mr. Harold Perrin and Mr. Alan Goodfellow, both of whom agree with a correspondent last week in complaining that the Flying Clubs' notes have been omitted from THE AEROPLANE for some considerable time.

Mr. Goodfellow's views whether in attack or defence are always worth having, so his letter is published herewith:—

The views of your correspondent accurately represent the feelings of most of us in the Light Aeroplane Clubs about your attitude towards Club Notes. For years we racked our brains to supply you with light reading matter on the lines of your Croydon Notes, believing that they might at least act as a sedative to your subscribers, whose nerves had been shattered by a perusal of your blood-and-thunder editorials.

Possibly we lacked the brilliance of "Spry" and "G.D.," but at least we did our best, and your attitude was not very encouraging. In spite of this my own Club still sends you *The Elevator*, together with Club Notes, whenever we can think of anything sufficiently solemn and portentous to be worthy of THE AEROPLANE'S pages. You cannot fairly blame any Club which does less in view of your rather discouraging attitude towards them in the past and at the present.

Some time ago you were referred to in the House of Commons as "a caustic but not uninformed writer." Judging by your recent remarks on the Light Aeroplane Clubs, you are in danger of forfeiting one word out of that description.

To assert that the Clubs are a decreasing force when the statistics

"THOU ART IN LONDON—IN THAT PLEASANT PLACE WHERE EVERY KIND OF MISCHIEF'S DAILY BREWING."

(BYRON—*Don Juan*.)

SEEING LONDON.—An Armstrong Whitworth Argosy (Armstrong Siddeley Jaguars), used by Imperial Airways Ltd. as a tea-plane, over the City of Westminster. The Houses of Parliament are in the middle of the picture, with Westminster Abbey below them, and the Government Offices bordering on St. James's Park on the left. Victoria Street runs vertically up the middle of the picture. St. Thomas's Hospital is on the far bank of the river, directly under the right wheel of the Argosy.

Digitized by Google

show that their membership and flying hours are increasing year by year is hardly logical. To assert that more machines are purchased by private owners than by the Clubs ignores the fact that a very substantial percentage of the private owners are drawn from the ranks of the Club members.

It is perfectly true that the importance of amateur organisations in flying will ultimately decrease as the importance of commercial organisations increases. It is perfectly obvious, however, that under existing conditions it will be a good many years before commercial aviation within our own shores can become a substantial economic factor.

Meanwhile, unless private and Club flying is fostered and supported the progress of flying as a whole in this country (including commercial aviation) will suffer.

In conclusion, one of the chief obstacles to flying at home is the uncertainty of our weather. *Must* you add to the prevailing bad visibility by constantly going up in clouds of steam?

Our Policy.

This letter shows that Mr. Goodfellow has to some extent rather misunderstood the general policy which inspires the conduct of The Aeroplane. It is true that this paper does try to amuse as well as instruct. But when the amount of space in the paper is restricted, then amusement must give way to instruction, and we who compose the Staff even cease being funny ourselves.

While the Club movement was still quite young, perhaps there was more need for amusement than for instruction. The Club Instructors were supposed to do all the instructing that was necessary, and the idea of The Aeroplane was, rather, to amuse the Members and to give them something to talk about besides what they learned from their Instructors.

In those early days of the Club movement, those who wrote the Club Notes were allowed a considerable amount of latitude, and a great deal of space was given to jests and jokes which could only interest the members of individual Clubs, or to inter-club jokes which might in a way stir up friendly rivalry between Clubs.

When the Club movement got going properly and quite a considerable amount of flying was being done, we had hoped that really valuable knowledge which was gained by one Club might be transmitted in the Club Notes to other Clubs. We hoped that thus in course of time we might collect something like a series of useful hints and tips for those who flew or maintained or operated aircraft.

Unfortunately, either the Club Secretaries or the Club Members never quite seemed to grasp this idea. The jokes became more and more feeble, and so much was happening in the development of aviation as a whole just then that space could not be spared for these jokes and for strings of figures and strings of names which were of no real interest to anybody except the members of the Clubs.

So, in the hope of making the Club notes more interesting, and at the same time, hoping to save space, we asked the Club Secretaries whether they would in future send in their Club notes once a month, instead of once a week. The idea was that they would then have, at any rate, three weeks in which to extract useful information from the ground engineers and the instructors, and from those Club Members who were really doing any serious flying, and would have time to put them on paper in a way which would make them of value to all readers as well as the actual Club members.

The Clubs' Failure.

Instead of such in fact happening, what did happen was that Club Secretaries forgot altogether to send in their Club notes at the end of the month, or at the beginning of the following month. And so instead of having, as we used to have before, something like a regular weekly record of Club doings, we only got a very irregular record of the Clubs' doings during the previous month. Also, much to our disappointment, these notes which were sent in once a month were even less interesting than those which had previously been sent in once a week.

Probably one of the reasons why the Club Notes have not contained the type of information that would have been really valuable to the progress of aviation, not only in this country, but all over the World, is simply that the majority of Club Secretaries are not technical men of any kind, and are far more concerned with the number of hours' flying done by their Club members than they are with the method by which the ground engineers and their skilled mechanics in the workshops manage to get so many hours flying at such small expense. From the purely secretarial point of view hours of flying are wrapped up in the effort to acquire the Government subsidy as cheaply as possible.

Obviously the smaller the number of hours flown the less is the cost of getting each pupil through his test for the "A" class certificate which entitles the Club to claim the Government subsidy on that particular pilot. But equally obviously it is not part of the Secretary's job to discover precisely how the number of hours is reduced. Here and there one particular Secretary might take a keen interest in the mechanical processes by which the cost of flying was kept down, but if so he was probably much too busy on his ordinary secretarial duties to have time to write up anything like a description of those methods for publication.

Helping the Clubs.

The end of it was that we had no alternative but to give up the Club Notes altogether, except when some individual Secretary or Member sent along something which was of genuine general interest. Naturally, full publicity was given to the dates of Club Meetings, whether Displays or Pageants on a big scale or merely purely local events,—that is so far as Club Secretaries thought it worth their while to keep this paper in touch with their doings.

EMPIRE PATROL.—Iris III (Rolls-Royce Condors) just before being launched from the Blackburn Factory ugh. Major Rennie, the designer, is seen on the right.

THE British Government and twenty other countries are continuing to use Napier aero engines because they have proved over and over again that they can be relied upon—no other engine has such a unique record of reliability.

The following are some recent achievements giving convincing proof of the reliability of *every* Napier engine—

THE FIRST NON-STOP FLIGHT FROM ENGLAND TO INDIA was accomplished by a Royal Air Force Fairey monoplane fitted with **NAPIER** engine —**4,130** miles in 50 hours 38 minutes.

THE FIRST FORMATION FLIGHT FROM ENGLAND TO AUSTRALIA was achieved by four Royal Air Force Supermarine "Southampton" flying boats each fitted with two **NAPIER** engines—**180,800** engine miles without mechanical trouble.

THE KABUL RESCUES. 600 men, women and children were conveyed to safety by **VICKERS-NAPIER** aircraft. Machines had to fly over mountainous country where landing was practically impossible and everything depended on reliability of engines.

Moreover, whenever a Club has put up anything in the way of a Display or a Pageant this paper has made a particular point of being very fully represented and of giving an account of everything that was done at the display. And we can fairly claim that no other paper can compare with THE AEROPLANE in the fulness of its descriptions or the quality of its pictures of flying meetings.

Certainly no Club which has displayed any energy in this particular way can complain that its activities have not been fully dealt with in THE AEROPLANE. In fact, if the space which last year and earlier was devoted to Club Notes had been given to that same subject this year, the only way in which it could have been done would have been by cutting down the space given to descriptions and illustrations of the many highly successful Club Meetings which have been held during the past Summer. In this way, at any rate, THE AEROPLANE can claim that it has given the Clubs all the publicity which they deserve.

Whether so much publicity can be given to Clubs during next year is another question. That must depend entirely on what sort of activities the Clubs themselves show.

THE PARTING OF THE WAYS.

The dividing line between light aeroplanes and commercial aeroplanes seems to be fading out. The International limitations of weight which define a light aeroplane are obviously useless, except for pure competition purposes. The light aeroplane which a private owner buys in which to go touring is considerably heavier than is the light aeroplane as defined by International agreement.

Developments may trend in either of two directions. Either somebody may produce a very much lighter aeroplane, which can be used either for Club work or for touring by the private owner, and may be inside the International limit of light aeroplanes. Or on the other hand somebody may produce a very much bigger and more powerful and heavier aeroplane at such a low price that the Clubs and private owners will find that it pays as well, or is just as cheap to run, as is what we call a Light Aeroplane to-day. A robustious aeroplane which uses more petrol may be cheaper to run than a delicate machine with light consumption.

From another standpoint, both the lighter and more efficient aeroplane and the bigger and more powerful aeroplane may both cost considerably more than does the existing type of so-called Light Aeroplane, and so the Clubs may go on using their existing type of training machine for years to come, while the private owners' aeroplanes drift off in the direction of higher efficiency and lighter weight and the genuine commercial aeroplane tends on the other hand towards greater size, weight and power.

PROGRESS.

After all, the chief function of THE AEROPLANE newspaper is to help forward the progress of aviation and not to record merely the doings of those who are standing still. Of all the various phases of aviation, that which is usually called commercial aviation is now becoming the greatest factor towards progress. This seems very natural, for after all if commercial aviation is to become a commercial proposition obviously it must have the most highly efficient aircraft and engines which are most economical to run.

Admittedly, great progress is being made in the design of Service aircraft. For example we have in the Hawker Hart and the Fairey Firefly and one or two other forthcoming developments, aeroplanes which have a speed of well over 200 miles an hour with full war equipment. In fact, our fastest high-speed fighter approximates quite closely to the purely racing aircraft which won the Schneider Trophy not so very many years back.

This, by the way, is rather an argument up against those who constitutionally object to the expenditure of Government money on what they are pleased to call racing flying, —though in fact this particular class of flying deserves rather to be classed as scientific research, or at any rate as technical development.

Apart from that the designs of Service aircraft are more or less stereotyped by what the technical experts of the Air Ministry consider to be the needs of the Royal Air Force. Furthermore, the Air Force is still more concerned with performance than it is with economical operation. Consequently aircraft built for the Royal Air Force are not likely to be designed with such a keen eye on sheer efficiency and cheapness of operation as are those designed purely for commercial work.

On the other hand, Club methods of training are fairly well standardised and the requirements of Club flying seem to have a tendency to stereotype the designs of Club training machines, almost as rigidly as do the requirements of the Royal Air Force. Therefore, naturally we must look for progress to the demands of commercial aircraft operators for more efficient machines and the demands of private owners for machines which are cheaper to buy and cheaper to operate and safer to fly and more comfortable to fly.

The private owner is a very considerable factor in aviation. Those who have already got, or who have had a chance of seeing, the interesting little Register of Aircraft recently published by Mr. Rupert Preston, cannot fail to be struck by the large number of private owners of aircraft in this country. Actually at the present moment there are probably many more aeroplanes owned by private owners than there are by aircraft operating companies. But sooner or later the bulk of the aircraft in this country must be owned by commercial firms. We are, in fact, only at the very beginning of commercial aviation.

NEW DEVELOPMENTS.

For the matter of that, we are only at the very beginning of aircraft design. There may be, in fact there must be, ways of making aeroplanes very much more efficient than they are at the present moment. Some day, no doubt, we will find that flying is the cheapest and the safest as well as the quickest method of transport. But that time is not yet, and we must be content at the moment with things as we can find them.

The most important thing to remember is that now, for the first time in the history of aviation, powerful financial groups are beginning to take a real live interest in commercial aviation. When people of this kind, who are accustomed to getting value for their money, start out to use aircraft as they should be used, they will find existing types of aircraft are of very little use for their needs. The result must be that they will insist on new designs, and that will immediately produce definite progress in aviation.

There is one outstanding example for a start,—the demand of the Aircraft Operating Company Ltd. for a special type of aeroplane with a special performance for air survey work. This machine was built to their requirements by the Gloster Aircraft Co. Ltd.

In building this particular aeroplane the Gloster people seem to have produced a machine which definitely has a higher performance in certain directions than has any other aircraft of its power. It does not happen to be designed particularly as a passenger-carrying aeroplane but it has extraordinary possibilities purely as a freight machine.

Specialised demands in other directions are bound to produce specialized designs. For example, in the United States there has been a demand for a special type of aeroplane to carry mail at high speed without any accommodation for passengers at all. This type of machine is now being built in vast quantities, according to our ideas at any rate, and it is doing very good work on the American Mail lines.

(To be continued.)

MODERN METHODS.

The following letter was received at this office on Nov. 20:—

22, Birchin Lane, Cornhill, London, E.C.3.

Dear Sir,—As several gentlemen connected with that Section of the Technical Press in which our Advertisements have been appearing have requested me privately to let them have advanced copies of the Prospectus to enable them to acquire a holding on bedrock terms, I am extending the privilege to all the Technical Press concerned and enclose herewith Prospectus and Application form for your personal use.

An interesting announcement will appear in *The Times*—*Financial Times*, etc., on Wednesday.

I enclose a notice which you might wish to reproduce or comment upon in your next issue.

I take this opportunity of thanking you for your interest and support in the matter of Editorial Notices, Articles, etc.

With compliments, Yours faithfully,
(Signed) P. W. SHOWELL (Publicity Manager).

With this letter was enclosed a prospectus of Metals Coating Company Ltd. soliciting subscriptions for an issue of 500,000 shares of 5s. each.

The Directors are:—

Frank B. Goodchild, "Shortmead," Hadleigh Road, Leigh-on-Sea (Chairman); Ernest Beck, 21, Fitzgeorge Avenue, West Kensington, London, W.14; William John Thompson, Harborough Hall, Blakedown, Kidderminster; Harry James Williams, 7, Iverna Gardens, Kensington, London, W.

This is one of the most amazing communications that one has received in something like twenty-five years' connection with newspaper work in its various phases. About the first thing which one learned in that excellent school the House of Iliffe of Coventry was that nobody connected with a newspaper could possibly have a financial interest in any firm in the business with which his paper was connected. Only by such entire dissociation can a newspaper be impartial, and do its duty by its readers.

So that there may be no doubt on this subject so far as THE AEROPLANE is concerned no notices concerning this firm and no comment about it will appear in THE AEROPLANE, nor will any more of its advertisements be taken. Perhaps the Directors whose names are given above would like to explain this extraordinary action on the part of their Publicity Manager.—C. G. G.

Air Ministry, November 19.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Capt. D. A. Fletcher (Camerons, R.A.R.O.) granted a S.S. comn. as a Flt. Lt. for three years on the active (Nov. 4); Lt. G. R. M. Robertson, R.N., is re-attached to the A.F. as a Flg. Off. with effect from Nov. 2 and with seniority of ne 16, 1924. Plt. Off. G. C. Butler is promoted to the rank of Flg. (Oct. 8); Flg. Off. R. Matheson takes rank and precedence as if appointment as Flg. Off. bore date Sept. 17. Reduction takes effect m Sept. 21; Plt. Off. B. F. Cox is placed on the retired list on ount of ill-health (Nov. 6).

The following Air Commodores are placed on the retired list at ir own request (Nov. 15):—B. C. H. Drew, C.M.G., C.B.E., E. L. rrard, C.M.G., D.S.O.

Plt. Off. E. J. Brighton is transferred to the Reserve, Class A ov. 19); Lt. Count A. D. R. Metaxa, R.N., Flg. Off., R.A.F., re- quishes his temp. comn. on return to Naval duty (Sept. 26).

MEDICAL BRANCH.—The following Flg. Offs. are promoted to the nk of Flt. Lt. (Nov. 15):—D. A. Wilson, F. E. Lipscomb, M. Clancy, P. O'Toole, G. H. J. Williams, S. B. S. Smith, V. V. Brown, J. F. Govern, M.B., W. Heron, M.B. Lt. C. M. Leckie (General List, my, Dental Surgeon) is granted a temp. comn. as a Flg. Off. ental) on attachment to the R.A.F. (Oct. 18). Capt. R. E. Edwards rmy Dental Corps) is granted a temp. comn. as a Flt. Lt. (Dental) attachment to the R.A.F. (Nov. 8); Flt. Lt. P. P. Hogan (Capt., my Dental Corps) relinquishes his temp. comn. on return to Army ty (Nov. 8).

ERRATUM.—Gazette of Nov. 12.—Promotions to Flt. Lt. and Sq. r.—For Oct. 13 read Nov. 13.

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The Honourable Henry C. H. Bathurst is anted a comn. in the Special Reserve as a Plt. Off. on probation ct. 26); Flg. Off. R. P. D. Brailli is transferred from Class A to ass C (Nov. 8).

Appointments.

Week ending November 25.

GENERAL DUTIES BRANCH.—Air Vice-Marshal T. I. Webb-Bowen, C.B., M.G., to R.A.F. Depot, Uxbridge.

Wing Commanders E. A. B. Rice, M.C., to No. 216 Sqdn., Middle ast, to command, 9/11. A. C. Wright, A.F.C., to R.A.F. Depot, xbridge, attending course at Senior Officers' School, Sheerness, 2/11. P. Don, to No. 502 Sqdn., Aldergrove, to command, 2/11.

Squadron Leaders C. B. Cooke, to Night Flying Flight, Biggin Hill, /11. R. M. Drummond, D.S.O., O.B.E., M.C., to R.A.F. Depot, xbridge, 15/11. A. P. Maurice, D.F.C., to E. and W. School, Cran- ell, 11/11. R. Young, to No. 9 Sqdn., Manston, 18/11. C. E. W. Foster, to R.A.F. Depot, Egypt, 9/11. P. C. Sherren, M.C., to A. and G. School, Eastchurch, 3/11.

Flight Lieutenants E. A. C. Britton, D.F.C., to No. 1 (Indian) Group H.Q., 8/10. T. C. Luke, M.C., to No. 21 Group H.Q., West Drayton, 1/11. L. Wanless-O'Gowan, to R.A.F. Depot, Uxbridge, 10/9. C. W. Attwood, to R.A.F. Depot, Uxbridge, 11/11. W. R. Day, to H.Q., Fighting Area, Uxbridge, 17/10. B. Ankers, D.C.M., to No. 2 (Indian Wing) Station, 13/10. A. Jerrard, V.C., to No. 5 F.T.S., Sealand, 23/10. M. D. Ommanney, to No. 28 Sqdn., India, 9/10. N. S. Paynter, to No. 1 (Indian) Group H.Q., 23/10. I. E. Brodie, to R.A.F. Depot, Uxbridge, 12/10. J. E. L. Drabble, to No. 45 Sqdn., Middle East, 1/11. W. J. Pearson, to No. 55 Sqdn., 'Iraq, 9/11. D. A. Fletcher, to H.Q., 'Iraq, 9/11.

Flying Officers A. H. Wheeler, to Aircraft Depot, 'Iraq, 9/11. L. B. McGoverne, to R.A.F. Depot, Uxbridge, 28/9. W. J. Pickard, to Aircraft Park, India, 7/10. P. G. J. Atkinson, to No. 11 Sqdn., India, 3/10. R. C. Greenhalgh, to No. 1 F.T.S., Netheravon, 7/11. J. S. Phillips, to No. 1 School of T.T. (Apprentices), Halton, 26/10. J. Rodger, D.S.M., to Station H.Q., Mount Batten, 5/11.

Pilot Officer M. E. Morris, to No. 12 Sqdn., Andover, on appointment to a S.S. Comn., 6/11.

MEDICAL BRANCH.—Flight Lieutenants C. W. Coffey, to H.Q., A.D.G.B., Uxbridge, 30/10. M. O'Regan, to R.A.F. Depot, Uxbridge, 17/10. P. P. Hogan, to R.A.F. Depot, Uxbridge, 21/10. R. A. W. Kerr, M.B., to Station H.Q., Mount Batten, 4/11.

Flying Officers A. E. Vawser, to R.A.F. General Hospital, 'Iraq, 8/10. H. C. S. Pimblett, M.B., B.S., to R.A.F. General Hospital, 'Iraq, 8/10. C. P. O'Toole, to M.A.E.E., Felixstowe, 7/11.

STORES BRANCH.—Flight Lieutenants H. Jones, to Station H.Q., Tangmere, 5/11. F. W. Taylor, to Station H.Q., Manston, 5/11. J. J. Ironmonger, to Station H.Q., Mount Batten, 4/11.

Flying Officers C. I. Fray, to R.A.F. Depot, Egypt, 19/10. W. A. Stagg, to No. 2 (Indian Wing) Station, 8/10. M. J. Scott, to No. 6 Sqdn., Middle East, 26/9.

ACCOUNTANT BRANCH.—Flight Lieutenant F. C. Langley, to M.A.E.E. Felixstowe, 11/11.

Flying Officer R. Cassels, to H.Q., 'Iraq, 9/11.

The Royal Air Force College.

The Air Ministry announces that the following appointment will take effect from Dec. 16, 1929:—

Air Commodore Arthur Murray Longmore, C.B., D.S.O., to be Air Officer Commanding, Royal Air Force, Cranwell, and Commandant of the Royal Air Force College in succession to Air Vice-Marshal Frederick Crosby Halahan, C.M.G., C.B.E., D.S.O., M.V.O., on the latter completing his three years' appointment.

AUXILIARY EFFICIENCY.—Marshal of the R.A.F. Sir Hugh Trenchard, Bart, G.C.B., D.S.O., presenting the Esher Trophy to Sq. Ldr. J. Fullerton, No. 602 (City of Glasgow) Bomber Sqdn., Auxiliary Air Force, in the City Chambers, Glasgow. Left to right: Sir David Mason, Group Capt. McNeece Foster, Sq. Ldr. Fullerton, Marshal of the R.A.F. Sir Hugh Trenchard, Lord Provost Kelly, and Capt. Menzies.

Another Pioneer Departs.

Yet another pioneer of Service aviation is gazetted out of the Air Force this week, and will be deeply regretted.

Air Commodore E. L. Gerrard, C.M.G., D.S.O., R.A.F., was one of those first four officers who were allowed by the Admiralty in 1910 to learn to fly at somebody else's expense, —to wit at the expense of Mr. Frank McClean and Mr. G. B. Cockburn and the Royal Aero Club. His Royal Aero Club Certificate No. 76 bears the date May 2, 1911. Of the original four, Lieutenants Gregory, Samson and Longmore, R.N., and Lieutenant Gerrard, R.M.L.I., Air Commodore Longmore is the only one now left in the R.A.F.

Eugene Louis Gerrard was born in Dublin in 1881 and was educated at Warwick. He joined the Royal Marines in 1900 and was promoted Captain in 1911, when he had already learned to fly. He was promoted Major by Brevet in 1914 for his services in Belgium.

One has clear and very pleasant memories of Air Commodore Gerrard in those days when he was learning to fly. Being a Marine he was naturally known as "Soldier" to his three companions in this nefarious business of flying, and that curious feeling, which amounts almost to antagonism, between the Marines and their shipmates of the Navy produced in those early days of Service aviation that same keen spirit of emulation which it produces in naval gunnery to-day between guns manned by Marines and those manned by the Navy.

Captain Gerrard in 1911, the first aviator in the Royal Marines, worthily maintained the high reputation of that distinguished Corps for smartness and energy. Among all the pioneer pilots at Eastchurch, not only those who joined the Royal Naval Flying School there later on but among the early civil pilots, there were none who handled an aeroplane better than he did.

When War broke out in 1914 he had already been promoted Squadron Commander R.N. He went to Belgium with the first naval contingent and established his headquarters at Antwerp, where among his pilots were Squadron Commander Spenser Grey, and Flt. Lieuts. Marix, Newton Clare and Sippe, who had joined the Naval Air Service before the War.

Squadron Commander Gerrard led a number of raids into Germany from Antwerp. Among them was the famous raid in which Sq. Comm. Spenser Grey bombed the railway station at Cologne and Flt. Lt. Marix blew up the Zeppelin shed at Düsseldorf. And there was also that humorous incident in which Sq. Comm. Grey and Flt. Lt. Newton Clare dropped a small bomb by accident into the projecting piece of Holland and shook Holland morally to its foundations. Thereafter Sq. Cdr. Gerrard did a great deal of valuable work at Dunkerque until the Summer of 1915.

After that he was promoted to Wing Commander and put in command of a wing in the Eastern Mediterranean, first of all in the Gallipoli campaign and later in the operations against the Bulgars from Salonika. In 1916 he was made a Companion of the Distinguished Service Order, and few men have better deserved that distinction.

When the R.A.F. was formed in 1918 he was a Colonel commanding a Group. In June 1920 he was appointed to command the R.A.F. at Malta and in August 1921 he came back to England to do a course at the R.N. Staff College.

In February 1922 he was appointed to command No. 1 Group R.A.F., then at Kenley, where in January 1923 he was promoted Air Commodore. In 1924 he went to Palestine as Air Officer commanding and in August 1927 he returned to England as Air Officer Commanding Air Defence Group, which rank he held until he left the Service.

Besides the D.S.O., which he won in 1916, he was made a Companion of the Order of St. Michael and St. George in 1919. And he was given the Belgian Order of Leopold in September 1919.

During his long and distinguished Service career Air Commodore Gerrard has made a number of firm friends who will deeply regret his leaving the Service, and all of them, not only those who knew him in his earliest days as a pioneer, but those who served with him recently as an officer of high rank, will wish him every success in his future undertakings.—C. G. G.

Air Commodore Drew.

Air Commodore B. C. H. Drew, C.M.G., C.B.E., whose retirement from the R.A.F. is also notified this week, was not one of the pioneers of aviation, but his personal charm has made so many friends for him in the R.A.F. that his going will be as much lamented as if he were one of the pioneers.

Bertie Clephane Hawley Drew was born in 1880 at Ryde, Isle of Wight, and was educated at Marlborough and the R.M.C., Sandhurst. He was gazetted to the Indian Army in 1898 and appointed to the Indian Staff Corps in 1901. He was promoted Lieutenant in 1901 and Captain in 1907.

During this period he served in China in 1900 and on the North-West Frontier of India, 1901-2 and in Tibet, 1903-4.

He was appointed Brigade Major shortly after the outbreak of War in 1914 and after becoming a G.S.O.3 and then a G.S.O.2. and serving as a Major with the 23rd Sikh Pioneers (Indian Army) he was badly wounded. He became a G.S.O.1 at the War Office early in 1917 and temporary Lieutenant-Colonel in the Indian Army.

In February, 1918, he was gazetted to a temporary commission in the R.F.C. as Lieutenant-Colonel and was appointed temporary Brigadier-General while employed as Director in the Department of Military Aeronautics.

He transferred to the R.A.F. on April 1, 1918, as a Lieutenant-Colonel, temporary Brigadier-General, and was promoted full Colonel on Jan. 1, 1919.

In August, 1919, he was given a permanent commission in the R.A.F. as Group Captain. At that time he was serving on the Air Staff at Headquarters, Middle East Command. He was promoted Air Commodore on Jan. 1, 1922, and was appointed to command the Egyptian Group, Middle East, which command he held until May, 1924, when he was appointed Chief Staff Officer at Headquarters, Inland Area.

In December, 1927, he was appointed Air Officer Commanding 23 Group at Grantham, which office he now vacates.

He was made a Companion of the Order of St. Michael and St. George in June, 1918, and a Commander of the Order of the British Empire (Military Division), in June, 1919.

The Flying-boat Cruise to Norway.

The first authentic news of a cruise by two Service Supermarine Southamptons (Napier engines) from Felixstowe to Norway and back, has been received in the form of a copy of the Swedish newspaper, the *Stavangeren* of Oct. 8, sent to THE AEROPLANE by a correspondent.

The *Stavangeren* states that the two flying-boats arrived at Stavanger at four o'clock in the afternoon of Oct. 7, having flown from Felixstowe in five hours, fifteen minutes in storm and rain. The *Stavangeren* recalls that it is more than fifteen years since Mr. Trygve Gran in a small single-seat aeroplane (a Blériot) flew across the North Sea to Jaeren, a 400 kilometres' journey which took four and a

SOUTH AFRICAN AIR FORCE EQUIPMENT.—The Westland Wapiti (part of the new equipment of the S.A.A.F.) in which Colonel Sir Pierre van Ryneveld, K.B.E., D.S.O., M.C., Director of the Union Air Services, recently flew from Cape Town to the Rand, a distance of 850 miles, at an average speed of 140 m.p.h.

Digitized by Google

lf hours. Mr. Gran's was the first flight across the rth Sea and "gave a tremendous impetus to the belief flying . . . . His only equipment consisted in a feeding ttle and some chocolate. All the remaining carrying pacity of the machine had been used for fuel."

ince then Stavanger, although ideally situated, has had no direct nection by air with the British Isles until yesterday afternoon, when, a south-westerly hurricane, two English seaplanes of the latest e came down in the harbour after having crossed from Felixstowe Suffolk, about 800 kilometres, in five hours and fifteen minutes.

The cruise was under the command of Group Capt. G. R. omet, D.S.O., O.B.E., with Sq. Ldr. C. L. Scott, D.S.C., as cond in command. The other members of the crews of the o flying-boats were Flg. Off. L. L. King, D.F.C., Plt. Offs. T. Shelley and F. C. Sturgiss and six airmen.

A member of the staff of the *Stavangeren* who went on ard the machines and interviewed the pilots wrote:—

Members of the Royal Air Force are men of few words and they not care to say much about the trip. "This is a practice cruise," d Captain Bromet, "arranged to give the pilots experience in g distance flights across the sea." "There was good visibility and strong south-west wind. We had prepared for rain and heavy ather during the latter half of the trip, and that came true. After ee hours' flight the rain commenced and the wind increased. was abaft the beam and it caused a leeway of 25 degrees N.E. aring this in mind we first sighted land at Obrestad lighthouse. herwise everything went according to programme."

Flying Officer King smilingly told us that he boiled ham and eggs on Primus stove during the trip. We cannot help thinking of Mr. an's feeding bottle and are glad to know that the time is past en one need be afraid of using a light in an aeroplane.

Motors and petrol tanks are placed above the hull between the ngs and thus permit the fliers smoking their beloved English arettes in the cabin.

"What do you think, Captain Bromet, of the possibility of a regular vice across the North Sea between Stavanger and England?" we ked.

"The time for that is not yet," answered the Captain. "The trip n be done, and when the wind is behind it may blow almost as hard it likes, as is proved by our trip to-day. But a regular service ght not to be started unless it can be maintained, and it could not maintained in such weather—the difficulty in getting back would too great. We had better wait till more powerful machines are ilt. But it will come sooner or later, and I think Stavanger would very suitable as a port on the Norwegian side."

R.A.F. Decorations.

A revised Royal Warrant governing the award of the istinguished Flying Cross, the Air Force Cross, the Disnguished Flying Medal and the Air Force Medal was sued by the Air Ministry and published in the *London azette* of November 1, 1929.

The amendment occurs in the twentieth paragraph and eads:—

Twentiethly, it is ordained

(1) That it shall be competent for Us, Our Heirs and Successors by n Order under Our Sign Manual and on a recommendation by or rough our Secretary of State for Air to cancel and annul the ward to any person of the above decorations or medals and that ereupon the name of such person in the Register shall be erased; ut that We, Our Heirs and Successors shall at all times have power restore any decoration or medal which may have been forfeited hen such recommendation shall have been withdrawn.

(2) That the forfeiture shall involve the cessation of any gratuity r pension in lieu thereof to which the possession of any of the foresaid decorations or medals might entitle the recipient, but no uch forfeiture shall extend to any sum of money which has already een paid.

(3) That when a forfeited decoration or medal shall have been estored, any gratuity or pension in lieu thereof which attaches to it hall also be restored.

(4) That a notice of forfeiture or of restoration shall in every case e published in the *London Gazette*.

Lastly, We reserve to Ourself, Our Heirs and Successors full power f annulling, altering, abrogating, augmenting, interpreting, or dispensing with these Regulations or any part thereof by a notification nder Our Royal Sign Manual.

Given at Our Court at St. James's, this 31st day of August in the wentieth year of Our Reign and in the year of Our Lord one thousand nine hundred and twenty-nine.

By His Majesty's Command, THOMSON.

The Abingdon Aerodrome.

In the House of Commons on Nov. 21, Capt. Crookshank asked the Under-Secretary of State for Air if his attention has been called to the protests against the establishment of a great aerodrome for military purposes in the immediate proximity of Oxford; and, if so, whether His Majesty's Government propose to continue a project which will go far in destroying the amenities of the University and in increasing the danger to which it might be subjected in time of war?

Mr. Montague said that his Noble Friend was aware that objections had been raised, and they had naturally received his most careful consideration. The site at Abingdon was, however, only decided upon after an exhaustive reconnaissance had failed to discover any feasible alternative in the vicinity, and the aerodrome now under construction was an essential part of the scheme for the air defence of this country. It was, in fact, more than five miles distant from the centre of the city of Oxford and arrangements would be made that transport proceeding to and from the aerodrome would normally avoid passing through Oxford and thus adding to the traffic congestion. It was not admitted that the establishment of this aerodrome would have either of the results which the hon. and gallant Member feared, and indeed, to judge by their tenor, the representations which had been made were largely due to misapprehension.

Transfers to the Reserve.

The following officers serving on short service commissions are due to transfer to the Reserve or to relinquish their commissions on the dates indicated on completion of their service on the active list of the R.A.F.:—

JANUARY-MARCH, 1930.

Flight Lieutenants:—Maurice O'Regan (Jan. 4); Arthur Leicester St. Aubyn McClosky (Feb. 2); *Charles Maurice Elton Gifford (Feb. 15); Joseph Patrick Hederman (Feb. 23).

*James Noel Douglas Anderson, *Harry Gayton Kirkman, *Archer Robert Prendergast, *Vyvyan John Somerset-Thomas, *Robert Stiven (Mar. 15).

*Ian Eustace Brodie (Mar. 18); Edmond Joseph Theophilus McWeeney, M.B. (Mar. 24).

Flying Officers:—William Francis Bryanton, Philip Bernard Chubb, Edwin John Ellis, Francis Stanhope Homersham, D.C.M., M.M., Lionel Beaumont McGoverne, Brian Elgar Moody, William Alfred Shorten, Vincent John Sofiano, Arthur Charles Watkins (Jan. 6).

Richard Dingle Adams, Edward Addis, Robert Leslie Burnett, Ernest Lewis Drew, Donald Salisbury Green, Nigel Kenneth Howard, John Cecil Noel, Charles Pakenham Vines (Jan. 17).

John Howard Barringer, James Stanley Blomfield, Colin Heard-White, James William Milne Nancarrow, Stanley Charles Parker, Walter Richard John Spittle, Frederick Basil Tomkins, Charles James Veevers, Duncan Stratford Eyre Vines (Mar. 14).

*Ulric Campbell De Burgh (hon. Flt. Lt.) (Mar. 20).

Maurice Brunton, Francis Walter Field, Francis Henry Hannaford, Geoffrey John Comyn Mahony, Vincent Corbett Taylor (Mar. 31).

(* To relinquish commission. Not liable for reserve service.)

Special Assessments.

The following officer and airmen have been awarded special assessments as shown on completion of a course of *ab initio* flying training at No. 3 F.T.S.:—

Special Distinction.—No. 363621 Acting/Sjt. King, A. F.

Distinguished Pass.—Plt. Off. A. N. I. Worger-Slade; No. 364251 Acting/Sjt. Roxburgh, H. A.; No. 365111 Acting/Sjt. Rook, T. G.; No. 365126 Acting/Sjt. Cann, G. H.

Notations have been made in the official records of the officer and airmen.

Engineering.

An Air Ministry Order states that Flt. Lt. A. F. Scroggs is entitled to the classification E*. on having successfully concluded a post-graduate course in Engineering at the Imperial College of Science and Technology.

Indian Cadets in the R.A.F.

In the House of Commons on Nov. 25, in reply to Lt.-Cdr. Kenworthy, the Secretary of State for India said that no Indian cadets had been trained as yet at the R.A.F. College, Cranwell, nor were any under training at present. Facilities existed for the training of Indian gentlemen at Cranwell, but as a result of the two Army and Air Force examinations so far held in India no candidate who had given Cranwell as his first choice had succeeded in qualifying for Cranwell.

Indian cadets who passed out of Cranwell would not be commissioned in the R.A.F. but in a separate Indian air force. As far as he knew, there were no Indians in the R.A.F. in India at the present time, and naturally it was desired to secure them.

[Mr. Benn's last two sentences seem to contradict each other,—unless he means that commissions in the R.A.F. will not be given to Indian subjects, but that the India Office is anxious to secure them for service in the ranks in India.]

H.M.S. Glorious.

The cruiser *Glorious*, which has been reconstructed as an aircraft carrier, will be ready to commission on Jan. 7, 1930. In March she will probably proceed to the Mediterranean to relieve H.M.S. *Courageous*, her sister-ship.

The following Units of the R.A.F. will be embarked in H.M.S. *Glorious*:—No. 405 (Fleet Fighter) Flight, No. 406 (Fleet Fighter) Flight, No. 408 (Fleet Fighter) Flight, No. 441 (Fleet Spotter Reconnaissance) Flight, No. 447 (Fleet Spotter Reconnaissance) Flight, No. 461 (Fleet Torpedo Bomber) Flight, and No. 462 (Fleet Torpedo Bomber)Flight.

A Court-Martial.

A Court-Martial was held at Chelsea Barracks on Nov. 19 and 20, under the presidency of Group Capt. C. D. Breese, A.F.C., R.A.F., when Flg. Off. H. O. Fellowes, R.A.F. (Stores Branch), was charged with obtaining money by offering cheques which were not met on presentation at the bank. He was further charged with desertion. In all there were sixteen charges.

The Court found Flg. Off. Fellowes guilty on ten of the charges including that of desertion. Sentence will be promulgated.

Digitized by Google

A Lecture on the Middle East.

A lecture of particular interest to the R.A.F. will be given at the Royal United Service Institution on Dec. 11 at 15.00 hours. The lecture will be given by Sir Edward Denison Ross, C.I.E., Ph.D., F.R.G.S., and the subject will be "The Situation in the Middle East." Major-General Sir Percy Cox, G.C.M.G., G.C.I.E., K.C.S.I., will be in the Chair.

Members of the R.U.S.I. may introduce two friends to lectures.

George is Not Amused.

The following letter has not been received:--

The Royal Air Force,
At-at-Sea.

Sir,—I learn with great disgust of the would-be humorous paragraph in THE AEROPLANE of Nov. 13 and the astonishing amount of publicity in the Daily Press which has resulted from it. I cannot imagine why anyone of such a retiring disposition as myself should have been put in this painful position.

I have become notorious in a night, and the peaceful privacy that I have enjoyed for so many years is now a thing of the past. My ancestry and even my anatomy are matters of public discussion. I cannot leave my quarters without being heavily disguised. I am pursued by the Press and haunted by historians.

I have even been dubbed a "Pilot's Assister,"—I, who have never been a sister to any pilot!

Yours more in sorrow than in anger,

GEORGE.

Cranwell Aerodrome.

An Air Ministry Order forbids aircraft to land, except in cases of emergency, at Cranwell Aerodrome on Dec. 13 and Dec. 17, the two days on which passing out inspections are being held.

Some Service Contemporaries.

The Journal of the Royal Air Force College has attained the second number of the ninth volume with its Autumn issue. In addition to the usual Station news, sports notes, etc., there are a number of interesting articles by Cadets and former Cadets.

Prominent among these is one called "Disregarding Advice," by Flg. Off. Clarke, a brilliant young officer who was killed at Brough last October. In the article Mr. Clarke tells how he came to build the Clarke Cheetah, a remarkably good light aeroplane, mostly out of scrap material rescued from the crash-dump, plus an assortment of odd spare-parts. The article is interesting and amusing and a valuable lesson in energy and enterprise.

Wing Cdr. G. S. M. Insall, V.C., M.C., has contributed an article on "The Aeroplane in Archæology," in which he discusses the finding of the Woodhenges on Salisbury Plain and some important ancient remains on the western side of the Mesopotamian Plateau.

An entertaining article on "Summer Hunting and a Little Cricket in Somerset" is one of the best things one has read anywhere.

Flt. Cdt. Sjt. Barrett describes a visit paid by the Fourth Term to the Royal Airship Works at Cardington, and another Flight Cadet has chosen the title "Some Wings and a Rope" to describe an article on very early experiments in aeronautics.

The Planesman has emerged in a striking new cover which seems to have been produced under the influence of Mr. Epstein. The magazine improves with every issue, and now includes news of most of the important Units in the Service. A particularly amusing contribution from H.M.S. *Courageous* gives some impressions of that vessel's trip from Malta to Palestine during the recent disorders. The R.A.F. Unit was temporarily established at and operated from Gaza.

The Felixstowe Foghorn enters its second year of existence in the November, 1929, issue and continues to be a cheerful little paper. Part II of "An Airman Joins the Navy" is all too short, but if it had been longer something might have happened to somebody.

The R.N. Staff College Dinner.

The 1929 session dinner will take place at the Royal Naval College at 20.00 hours on Dec. 19. The attached officers of the present course have been invited as the guests of the evening.

All officers who have been through the Royal Naval Staff College are welcome to attend as honorary members. The cost of dinner will be 3s. 6d. a head, excluding wines.

Accommodation is available for honorary members at the Royal Naval College on the night of Dec. 19-20.

Officers wishing to attend are requested to inform Cdr. J. H. Edelsten, R.N., R.N. College, Greenwich, S.E.10, before Dec. 12, at the same time stating if they require accommodation. Dress for honorary members—mess undress, or dinner jackets.

PERSONNEL AND MATERIEL.—The Iris III (Rolls-Royce Condors) at Brough, with the R.A.F. personnel in charge and men of the Blackburn Works.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

PERFORMANCE FIGURES

ATLAS WITH JAGUAR ENGINE AND TOWNEND RING

Brevity.

The Hon. Lady Bailey, Flt. Lt. R. L. R. Atcherley and Flt. Lt. H. R. D. Waghorn, A.F.C., were among the Guests at a dinner given by the British Sportsmen's Club to famous sportsmen and sportswomen on Nov. 20. All three were called upon to make speeches and the time taken by the three speeches was just over three minutes.

The Junior United Service Club.

At an extraordinary general meeting of the Junior United Service Club on Nov. 20 a resolution was carried altering the rules in such a manner as to admit to election for membership, among others, of officers of the Auxiliary Air Force.

The R.A.F. Fencing Union.

The annual fencing competition for novices will be held at the School of Physical Training, Uxbridge, on Dec. 12 to 13; it will be divided into two classes as follows:—

(i) *Senior class.*—Open to all officers and airmen except (*a*) Previous winners in the event, for the weapon concerned, in the novices' competitions during the last three years. (*b*) Previous winners in the event, for the weapon concerned, at the Royal Tournament. (*c*) Personnel attached to the School of Physical Training. (*d*) Fencing "Blues."

(ii) *Junior class.*—Open to all officers and airmen who have not previously taken part in the novices' competition.

No competitor may enter under both classes.

The events in both classes will be for all weapons; foil, épée, sabre, and bayonet.

Entries should reach the Commandant, School of Physical Training, R.A.F. Depot, Uxbridge, by Dec. 5. Fencing will begin at 9 a.m. on Dec. 12.

If necessary, accommodation for competitors will be provided from 4 p.m. on Dec. 11; applications for accommodation should be forwarded with entries.

Squash Rackets.

The R.A.F. Club beat the Bath Club in the first division of the Inter-Club Squash Rackets tournament for the Bath Club Cup in the R.A.F. courts on Nov. 20, by two matches to one. H. Coverdale (R.A.F.) beat K. A. Wagg (Bath Club), by three games to two. J. S. Heagerty (R.A.F.) lost to I. Akers Douglas (Bath Club), by three games to one. P. Q. Reiss (R.A.F.) beat V. A. Cazalet (Bath Club), by three games to none.

Boxing.

A boxing match between the R.A.F. and officers and cadets of the R.A.F. College, Cranwell, will take place at Cranwell on Nov. 28.

A boxing match between the R.A.F. and the Danish Amateurs will take place at Cranwell on Nov. 29.

Association Football.

R.A.F. v. London University:—The R.A.F. beat the London University at Henlow on Nov. 20 by seven goals to nil. The *Morning Post* account of the game states:—

With such skill and enterprise did their inside forwards play that the Royal Air Force ran London University off their feet at Henlow yesterday, and won in easy fashion by 7 goals to nothing. Knight, centre-forward, got four of the goals, but he owed much to the support he got from his inside men, Kelly and Aquaroff.

Kelly, inside-right, who played for Ireland in amateur international games, was the big man of the match. He made opening after opening for the rest of his line. His shooting was very much on the mark. Had he a little more fire behind his boot he could hold his own in any company.

I liked Aquaroff also, who worked thoroughly and unostentatiously at inside-left, and, as usual, Robinson stood in a class by himself in the half-back line. His flank men, both new to representative football, were untiring workers. Indeed so good were the half-backs that Pond, James, and Chaston had little to do. Kelly (2) and Aquaroff got the other goals.

VICKERS ORDERS.

An interesting order has recently been received by Vickers (Aviation) Ltd. from the Irish Free State Department of Defence for a number of Vickers Vespas. These are two-seater Army co-operation machines with Armstrong Siddeley geared Jaguar engines. There is interest in noting that machines of the same type have been supplied to Bolivia. They have to operate from the La Paz Aerodrome at a height of 14,000 feet, where Mr. H. W. R. Banting is in charge of them. One hopes to be able to say some more about these machines in Bolivia before long.

A CHANCE FOR THE BRITISH.

A correspondent of *The Times Trade Supplement*, writing from Berne (Switzerland), states that an extensive scheme for the reorganisation of the Swiss Army Flying Corps is being considered by the Federal Military Department. This scheme will necessitate the grant of 20,000,000 Swiss francs and involves the purchase of 60 fighting and 45 reconnaissance machines.

This correspondent says that offers and detailed specifications should be forwarded without loss of time to the Swiss Military Authorities direct. In no case should the firm making a tender fail to express willingness to send demonstration aircraft to Switzerland. This is a point of the greatest importance, as in the past such demonstrations have sold foreign machines.

AIRSHIP NOTES.

A Parliamentary Disappointment.

The special Parliamentary flight of the R.101 arranged for Nov. 23, which had been postponed from the previous Saturday, did not take place. One understands that this much-talked-about trip will not happen for some time now, as R.101 will be re-kennelled at the first opportunity, to make room at the mast-head for R.100 which has been formally taken over by the Air Ministry for flying trials.

The various Peers, Bishops, M.P.'s and newspaper correspondents were given lunch on board in two shifts of 50 each, while R.101 was anchored to the mast-head, as the weather was too bad for a flight.

R.101 in the House of Lords.

In the House of Lords, on Nov. 20, Lord Newton asked the Secretary of State for Air why the airship cruise arranged for Nov. 16 had been abandoned, and said that he believed this form of locomotion to be a form of public extravagance largely stimulated by the Press and a concession to sensation.

Lord Thomson said that, with a few exceptions the Press had not encouraged the Government in this "form of public extravagance." The flight on the 16th had not been postponed on account of the roughness of the weather.

The new airship had stood up to weather four times as bad from the point of view of the force of the wind, as that experienced on that day. She had been in the air for 19 days. Moored to the mast she was exposed to far greater strains than she would be loose in the air. The wind rose to gusts of 83 miles an hour while she was moored. The pressure at the nose had been recorded at 15[illegible] tons and her strength was calculated to meet a pressure of 30 tons at the nose. If the pressure of 30 tons was ever reached all that would happen would be that the order would be given to "slip the ship."

The flight had been postponed on the occasion in question because the Air Ministry wanted to give Members of Parliament an enjoyable trip. On a normal cruise on that day there would have been nothing but driving rain.

The Air Ministry were very much on their mettle in this matter; they were praying more earnestly than anybody for a flight. He he would like to remind their lordships, had, since the postponed flight, flown 1,200 miles—a circuit of these islands almost—in the rain, and mist, had found its way back, and was moored in a very dense fog. That was really a rather remarkable achievement, due to the refinement of direction-finding by wireless.

There had been a great deal of inaccurate information in the Press as to the cost of this airship and the airship programme generally. He hoped at no distant date to be able to prove to their lordships that the amount of scientific knowledge acquired by these experiments would alone almost have justified the expense incurred.

The Maintenance of R.101.

In the House of Commons on Nov. 21 in reply to a question by Mr. Naylor, the Under-Secretary of State for Air said that the average weekly cost of maintenance during the few weeks that the R.101 had been in the air, inclusive of hydrogen, as well as overhead charges, wages of staff and crew, and repairs, had worked out at approximately £600. The repairs included were only running repairs while at the mooring tower. Expenditure on fuel was not included as it varies directly with the amount of flying. Much longer experience would be necessary before it was possible to give an all-in average figure which would be useful as a guide to the cost of commercial operations.

[Which means roughly £35,000 per annum to run.—Ed.]

Handling the Airships.

In the House of Commons, on Nov. 20, Lt.-Cdr. Kenworthy expressed an earnest wish that civilian and not military labour should be used in handling the two airships. Mr. Montague said that civilian labour was used as far as possible, but for these purposes it was very necessary to have a disciplined body of men.

GEORGE T. CUDDIHY.

According to the New York correspondent of *The Times*, Lieut. George T. Cuddihy, U.S.N., was killed on Nov. 25 at Washington, when a machine which he was testing for the United States Navy crashed from 10,000 ft. at Anacostia.

The machine, according to the report, was a Bristol Bulldog, bought by the U.S. Navy in September. When the machine had dived 4,000 ft. Lieut. Cuddihy was seen to be making efforts to straighten out. During the remaining drop part of the machine was seen to break off and fall and land some distance away.

If this story be true, the assumption is that the pilot was deliberately doing a "break-up" test, and unhappily failed to get out with his parachute. In any case, we had better await an official report before accepting this evidence.

Lieut. Cuddihy put up a World's Record of 188.82 m.p.h. at Baltimore in 1924 in a Curtiss C.R.3, and he was a competitor in the Schneider Trophy Contest in 1925.

His death will be greatly regretted by many personal friends in this country, and everybody will lament that one who has made history and has helped progress by gallant flying as he has done, should come to such an end.—C. G. G.

"Bristol"

BULLDOG

SINGLE SEATER FIGHTER

In the design of the "Bristol" Bulldog the latest "Bristol" practice in high tensile steel strip construction has been incorporated, and the results of years of research and development work with steel aircraft structures are applied.

Climb and performance well in advance of anything previously obtained with a standard service aircraft are attained, along with ease and facility of control, exceptional strength, ease of maintenance and remarkable simplicity of repair. The Air Service, the pilot and the maintenance engineer—all agree that the Bulldog is the most redoubtable and practical aircraft obtainable to-day.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

THE USE OF WHEEL-BRAKES ON AIRCRAFT.

Vith the development of aviation, the problem of reduc- the landing or ground run of aeroplanes has increased importance, particularly because of the restricted and igested areas of many commercial aerodromes. Several thods have been considered and used for this purpose. ese have been largely methods for increasing the drag, ıer aerodynamically or by friction of the tail-skid on ground. The most widely used method, although not of the proportions of universal use, which provides the st detrimental effect aerodynamically, is the use of wheel-kes.

Vheel-brakes were consistently avoided for many years account of the belief that their use would produce an rturning moment which would be dangerous. Within last few years, however, wheel-brakes have been adapted aeroplanes in the U.S.A. with considerable satisfaction. th this in mind, the U.S. National Advisory Committee Aeronautics determined upon a programme of inves- ation into the effects of their use, and it has now pub- hed a Report* dealing with these investigations.

A Douglas M.3 single-engined mail plane was equipped ih an internal-expanding type of wheel-brake with a ecially devised mechanism for operation differentially foot pedals. A tail-wheel replaced the usual tail-skid.

This machine was selected as it had a large range of sposable load and it was desired to investigate the condi- ıns of landing under various loading conditions, as well as ıder various wind velocities. It was found that in the htest condition—that is, with a minimum amount of el and pilot alone—the gross weight was 3,785 pounds. ıe intermediate load consisted of a full fuel load, pilot, ıd one passenger, making a gross load of 4,685 pounds, ıd the heavy load, with the addition of 700 pounds of lead ıot in bags, made a gross load of 5,385 pounds. Landing ith each of these three conditions of loading was studied each of three different wind velocities of approximately 10, and 17 m.p.h. The actual wind velocities at the oment of landing, measured at a point as close to the oint of landing as possible, were used in the preparation the data.

All landings were made on a selected portion of the land- ıg field which was as smooth and dry as possible, and on hich the grass was not more than 6 inches in height. In ddition to the variation of loading and wind velocities, ıe brakes were used in two ways: (1) the brake pedal orce was applied smoothly throughout the landing; and 2) the brakes were locked in the air before the landing as made and held in this condition as far as possible roughout the ground run.

The following instruments and measuring methods were used: (1) an N.A.C.A. recording air-speed meter to obtain the air speed at the moment of landing; (2) an N.A.C.A. single component accelerometer to indicate the point of landing; (3) an N.A.C.A. timer to synchronise the air speed and accelerometer records; (4) a hand-type of anemometer, installed upon a mounting 6 feet above the ground in the vicinity, and observed at the moment of landing, to determine the wind velocities.

The distance covered in the ground run of the aeroplane was measured by a tape, as it was found that the point at which the aeroplane touched the ground was easily determined by using a number of ground observers before whom the landing was made at close range. As these observers approached the point of contact according to their visual observation they invariably found readily distinguishable marks upon the turf where the wheels had first made contact. The other end of the run was positively determined by holding the aeroplane at the position at which it stopped until the measurement was completed.

From the numerous landings thus observed, the curves of ground landing speed against ground run were plotted. The ground speed was determined by subtracting the wind velocity from the air speed of the aeroplane at the moment of landing, as determined by the methods described above.

For all three conditions of loading the application of the brakes after landing was considered the normal method of operation. This method gave a consistent reduction in length of landing run as compared with the length of run without brakes. A further reduction in length of run may be obtained by applying the brakes before the landing and holding them in the locked position throughout as much of the landing run as is possible. This, however, is an unusual and somewhat rough method of handling. Under some conditions and with some aeroplanes it may be expected that a tendency to nose over or to ground-loop badly will occur with this method of handling. In the case of the machine carrying the intermediate load and, to some extent, the machine carrying the heavy load, it was found that at the higher speeds of landing the curves of ground run with the brakes applied before landing, had a tendency to converge toward the curves of ground run with brakes applied after landing. This is explained by the fact that in these tests the tendency to nose over or to ground-loop became sufficiently great to force the pilot to relieve the braking pressure.

It was also noted that the landing run in the light load condition without brakes was longer than in the intermediate condition of loading. This was due to the fact that in landing in the light load condition it was very difficult to get the tail down so as to effect a good three-point landing. This condition is inherent in this type of aeroplane when so loaded. The landing was therefore made at a low angle of attack, with correspondingly low drag, and hence the air speed at the point of landing was from

[*N.A.C.A. Technical Note No. 311. The Use of Wheel-rakes on Airplanes. By Thomas Carroll and Smith J. De rance. The Langley Memorial Aeronautical Laboratory.]

WHEEL-BRAKE EQUIPMENT.—The type of wheel-brake and tail wheel fitted to the Douglas M-3 mail plane for experimental purposes.

Digitized by Google

three to five miles faster than it would have been with a normal three-point landing.

Tests and measurements were conducted in the same manner on a Douglas O2-H single-engined two-seat reconnaissance biplane. The results from these two quite different types were in agreement, which confirms the opinion that the results on the Douglas M.3 are applicable to most other types.

In the preparations for these experiments, brakes were used and studied upon a number of military and commercial aeroplanes. Efficient wheel-brakes of both the internal-expanding and external-contracting types have been used. The methods of operation are, however, of greater diversity. They may be hand-operated or foot-operated, individually operated or equalized and used simultaneously.

While the value of wheel-brakes is clearly evidenced by the material reduction in ground run which they afford, it should be noted that they provide other advantages of very great value. It has been found that they provide easy manœuvrability, aid in making very short turns while taxying; and enable the pilot to offset tendencies to ground-loop. The aeroplane may also be held without chocks while warming up the engine, by locking the brakes. With these secondary ends in view, it can be seen that the equalised, simultaneously-operated brake is of reduced value on single-engined aircraft. Multi-engined aeroplanes, of course, may be manœuvred by use of the outboard engines individually.

The hand-operated control of brakes can hardly be recommended where it is necessary for the pilot to use them, but they prove quite satisfactory where an assistant pilot or mechanic is available to work the brake control, as on large commercial types. Individually foot-operated brakes offer by far the greatest advantages. These usually have taken the form of additional small pedals attached to the rudder bar or rudder pedals or, as has at times been done, by separate brake pedals in no way connected with the usual rudder controls.

The brake controls connected to the rudder control have been so installed as to be operated by the toe or by the heel and in other cases a treadle, which is operated by rocking the whole foot. Many of these are quite satisfactory. Some introduce a difficulty, as it might be possible to use the brakes unintentionally at improper times, such as in taking-off.

It might be possible to alleviate these difficulties, whether the operation was by toe or heel, by fitting a lever control which, in a first position, would lock the wheel-brakes without pressure on the pedal-control, in a second position would permit the individual use of the wheel-brakes, and, in a third position, would entirely cut out the braking system from operation by the pedal-controls. This arrangement would permit the wheels to be locked in a similar way to an automobile hand brake in the first position, in the second position would permit the usual brake operation, and in the third position, would prevent unintentional use of the brakes.

The successful operation of brakes is largely dependent upon the position of the landing gear and wheels with relation to the centre of gravity. The wheel position should be well forward, as is now becoming the common practice, in order to counteract the tendency to nose over. This will not present any unusual difficulty due to tail heaviness on the ground, because with the use of the tail-wheel the necessity for lifting the tail in ground handling will be eliminated.

It should also be borne in mind that tail-skids are very destructive to the surfaces of landing fields. It will only be a matter of time when the use of the tail-skid will be prohibited or penalised on all regulated airports. The replacement of the tail-skid with a tail-wheel will, of course, necessitate the use of wheel-brakes.

The use of wheel-brakes imposes a load upon the tyres which the usual aeroplane type of untreaded tyre is not capable of standing. Aircraft tyres for use with brakes should have an additional heavier tread. Whether the additional tread should be smooth or of the non-skid type, is a matter of selection. The non-skid type will undoubtedly give more effective braking, although its tendency to tear may be as great as in the smooth tread aircraft type of tyre.

Aircraft upon which it is intended that wheel-brakes are to be used, should be so designed as to eliminate the tendency to nose over by placing the landing gear far enough ahead of the centre of gravity.

There can be no doubt that wheel-brakes are of very great advantage on any aeroplane, particularly when the aeroplane is equipped with a tail-wheel in place of a tail-skid. Their use is not limited to the reduction of ground run, but is of very practical additional advantage in ground manœuvres.

From these experiments and experiences it is evident that wheel brakes are necessary equipment on an aeroplane. The only tenable reason for omitting them from a new design must be the desire to reduce the cost to the lowest possible figure.

WHEEL-BRAKE PROBLEMS.

On Nov. 8, Mr. Hall, of Bendix-Perrot Brakes, Ltd., of Birmingham, read a paper on "Aero Wheel-Brakes" before the Westland Aircraft Society at Yeovil.

The Lecturer began by making a few general remarks on the present situation of aircraft brakes and explained how the Trade was only just emerging from the stage when aero-wheel-brakes were merely adapted forms of automobile wheel-brakes. The Bendix-Perrot Company is making research, after abandoning the ordinary motor-car two-shoe brake as inefficient.

The Lecturer stated that the average reduction in the landing run of machines fitted with the modern Bendix-Perrot brake was 50 per cent., and that the fitting of brakes has the effect of assisting the ground crew. Furthermore it permits the use of a tail-wheel instead of a skid, which thereby prevents the destruction of the surface of aerodromes and eliminates wear and vibration to the aeroplane structure to a very large extent.

Servo-control has been found to be necessary and in combination with this, the ideals aimed at by the brake industry are safety and simplicity. In this instance the type of brake is the self-energising servo system which gives full action under slight pedal pressure. In this type of brake the primary shoe has no fixed anchor but hinges on the floating end of a secondary shoe. In this respect the action of the primary shoe in engaging with the drum tends to hold it in position and through the floating hinge the primary shoe energises the secondary one.

The Lecturer, however, did not venture on the other systems of braking, such as hydraulic, etc., but merely remarked that the Bendix-Perrot Company had quite an open mind on the subject and were still experimenting along these lines.

Various slides were then shown on the screen and the Lecturer indicated how the best position of the cam spindle is just vertically above the axle. It can, however, be placed anywhere on the periphery, according to the type of aircraft to which it is fitted. This vertical position is best, as it is farthest from the ground with the operating lever clear of ground obstruction so that it is therefore not likely to suffer damage. Furthermore, when wear takes place the vertical position of the cam permits of adjustment being made to allow for such wear on the axle.

The whole of the brake backing-plate and drum is press work, or bar work, and the use of electron is now being considered. The standard sizes of brakes at present in use are the 10, 12 and 20 inches, but larger sizes are contemplated. The clearance for a 12-inch brake is about 15/1000th and the construction of the brake is all-steel, which is cadmium-plated.

Mr. Hall laid it down as a strict rule that whenever brake-shoes needed to be re-lined it was necessary they should be sent back to the Bendix-Perrot factory where they would be exchanged for new shoes. This course was preferred, as in certain cases where shoes had been relined locally the results had been poor.

The following questions were paramount in discussing the problem of aircraft brakes:—

(1) The design of the undercarriage and the question of how the torque is to be transmitted to the fuselage.

The operating mechanism of the Bendix wheel-brake.

(2) The fore-and-aft position of the wheels and their brakes. (The farther forward the brakes and wheels are located the more torque is transmitted—but more load is placed on the tail in such a case.)

The torque load formula is:—One half weight of machine on one wheel multiplied by the effective tyre radius, multiplied by the co-efficient of friction of tyre on the ground, multiplied by the factor of safety of a shock landing.

(3) A wide wheel-tread is desirable. Bendix-Perrot work to a deflection of a quarter of the diameter of the tyre and they take the co-efficient of friction in excess of .8 on clean concrete with the tyre on the ground.

With regard to deceleration, a comfortable retardation for cars is at the rate of 22 ft. per second squared. With aeroplanes, however, the deceleration of 14-16 ft. per sec. squared is desirable. At the moment, good brakes give a retardation of about 8-10 ft. per second squared.

In this consideration it should be remembered that concrete aerodromes will probably become standard in time.

Other points of interest in the lecture were:—

(1) Brake effectiveness remains constant below 30 miles per hour. After that the wings begin to take up the lift.

(2) The accuracy needed for the axle is plus or minus 1/1000th.

(3) Hook-up control. For single-engined machines a separate control is needed for each wheel, or they may be differentially operated. There should be only a 7 degree movement of the control lever from the position *off* to the position *on* if all is in order.

Bendix-Perrot Brakes Ltd. prefer rod control with bell cranks to other methods.

With regard to pedal-operated brake-gear, a parallel motion linkage is necessary. In this the stirrup type is the best and this type is largely used in America, though at the present moment Great Britain seems to prefer the radius bar control. It was found that hand-operated brakes are not quick enough in operation.

THE GUGGENHEIM SAFE AIRCRAFT COMPETITION.

The final date for the entries for the Guggenheim Safe Aircraft Competition to reach Mitchel Field, New York, was Oct. 31.

Of the original twenty-five entries, nine have been withdrawn without any attempt to submit a machine. Four were delivered to Mitchel Field and withdrawn either before or after part of the eliminating trials had been made. And one was eliminated for failure to meet the qualifying tests.

There are still four entrants which have given no intimation whether they still wish to submit entries. Included in this four are the two Autogiro entries, one from Senor Don Juan de la Cierva and the other from the American Autogiro licensees, the Pitcairn Autogiro Co.

At the time of the drawing up of the rules for the competition it was frequently suggested that they had been written round the Autogiro, and that if that type of machine could meet the high speed and take-off requirements it would be assured of winning the contest. The failure of the Autogiro to be present is therefore regarded with astonishment

Nine entries are definitely in for the Contest. These are by Handley Page Ltd.; the Curtiss Aeroplane and Motor Co.; the Schroeder-Wentworth Associates; the Cunningham-Hall Aircraft Corporation; Fleet Aircraft, Inc.; V. J. Burnelli; Ford-Leigh Safety Wing, Inc.; the Bourdon Aircraft Corporation, and the Taylor Bros. Aircraft Corporation. Only three—the Curtiss, the Handley Page, and the Fleet—have actually completed tests at Mitchel Field.

Hereafter follows short descriptions of those entries which have presented themselves at Mitchel Field.

The Curtiss Tanager.

The Curtiss Tanager is an enclosed cabin biplane with a 170 h.p. Curtiss Challenger six-cylinder radial air-cooled engine. It is a conventional single-bay biplane with a total wing area of 330 sq. ft.

Automatic slots are provided over the entire leading-edges of all wings with manually operated flaps on the trailing-edges. The auto-slots are of the type developed by the Curtiss company on the Handley Page patents and have all operating mechanism inside the leading edge of the wings.

In addition, the Tanager is fitted with floating ailerons which are said by the designers to provide lateral control in any attitude. These ailerons are fitted outside the wing-tips of the bottom planes and are suspended from the top planes by steel tube Vee struts, the apices of the Vees being hinged to the single spars of the ailerons. They are operated by torque tubes running through the bottom planes.

The mechanism is so designed that the ailerons can be operated in the usual manner at any setting that they may assume or virtually at any angle of attack of the wing. Their leading edges form a continuation of that of the bottom wings and their chord is somewhat less than the wing chord. In all other respects the machine is conventional except that the oleo-undercarriage has double the travel normal in aircraft of this type and weight.

The Cunningham-Hall X Biplane.

The Cunningham-Hall is a two seat open-cockpit biplane with a 60 h.p. Walter radial air-cooled engine. It embodies an aerofoil designed by Messrs. R. F. and T. P. Hall some three years ago.

In general appearance it represents an inverted equal-spanned sesquiplane with a top wing one-third of the chord of the bottom, with the two wings inter-connected by inverted Vee struts. The top wing is a single spar structure and the rear half of the entire wing forms the ailerons.

The bottom wing is actually formed by two thin aerofoil sections superimposed one above the other and staggered in relation to one another. Just behind the underside of the leading edge of the top surface and in front of the leading edge of the bottom surface is a small aerofoil-sectioned and pivotted flap which closes the passage between the surfaces.

Hinged to the trailing-edge of the bottom surface is a flap which is operated in conjunction with the forward flap so that when the rear one is pulled down the front flap opens and so allows air to pass between the surfaces.

In the closed position the wing is of the Clark "Y" section.

It is stated by the designers that the C.P. travel of the bottom wing is virtually the same when used in either high or low lift conditions. It is also planned to instal spoilers on the top wing so linked as to be operated by the last two degrees of aileron travel.

The structure of the machine is of steel and duralumin with fabric covering. The undercarriage has a vertical travel of 9½ inches and is fitted with wheel-brakes

The Schroeder-Wentworth Monoplane.

The Schroeder-Wentworth entry is a high-wing braced monoplane with a 130 h.p. Comet radial engine. It has one big monoplane wing with the engine mounted on the leading-edge. Slung below the wing is the fuselage, which has closed accommodation for the crew.

The wing is in three sections. The front section is fixed and rigidly braced to the fuselage.

The middle section is hinged to the front section and is moved up and down by a transverse Vee strut, the upper ends of which are attached to the rearward edges of the middle section, with the apex within the fuselage.

The third, or trailing, section is composed entirely of flaps and ailerons and is linked with the middle section so that it moves in conjunction with it.

The middle section has an angular travel of 16 degrees and the rear section an additional travel of 40 degrees.

On the front section are spoilers, which are operated by a cam mechanism acting in conjunction with the aileron control.

The Vee operating strut is raised and lowered by a hydraulic mechanism in the present model, but it is planned to make the control automatic in any future models.

The oil-cylinder used to actuate the flap-mechanism is of the double-acting type with a bye-pass for the oil. The bye-pass is provided so that the oleo-mechanism will act as a dash-pot to retard the motion when the mechanism is operated automatically by travel of the centre of pressure. In hydraulic operation the loads on the operating mechanism are taken by shock-absorber cord.

The machine is also fitted with a Schroeder variable-pitch airscrew. This airscrew is controlled automatically by travel of the centre of pressure and centrifugal force on the airscrew blade, and provision is made for two settings having a six-degree variation. A ratchet mechanism holds one blade in either of the two positions, and a linkage between the two blades produces equal changes of pitch in both blades.

The Handley Page Biplane.

The Handley Page biplane is a two-seat tractor biplane with an 150 h.p. Armstrong Siddeley Mongoose engine and Townend ring cowling.

The entire leading and trailing edges of the wings have automatic slots and flaps. The outer sections of the top wing flaps perform the duties of ailerons and are manually controlled.

The performance of the Handley Page biplane in the hands of Mr. Cordes has astonished everyone at Mitchel Field. After a run of not more than 100 ft. at a speed of about 25 m.p.h. the pilot pulls the control column hard back and the fore part of the machine takes off with the tail skid trailing on the ground. As the angle of the machine increases, so that slots and flaps all operate, the requisite lift is obtained and the machine takes off. The machine will continue to fly at the exaggerated angle without loss of forward speed.

If the extreme stalling angle is reached the machine simply corrects itself, the pilot always retaining complete control over his lateral balance.

When landing, the pilot approaches to about 100 ft. from the ground, pulls his control column hard back, and descends parachute-like at an angle of 45 degrees to within a few feet from the ground. Then he flattens out enough to spare his tail-skid and undercarriage. Both the take-off and the landing are helped by the skilful use of the wheel brakes.

THE REST.

Of the rest of the machines little news is yet available.

The Burnelli is a two-seat twin-engined monoplane, with two American Cirrus engines and an expanding and variable camber wing surface like that fitted to the French Gastambide-Levavasseur monoplane which was produced some sixteen years ago. This consists of a middle fixed surface—that is to say, the part between the front and rear spars—with two moving surfaces—leading and trailing edges—which slide over the top of the middle section one fore and one aft and so increase or decrease the chord and camber. It also has a four-wheeled undercarriage with special wheel brakes and tyres.

The Fleet biplane is a perfectly standard Fleet Model 2 open two-seat biplane with a 100 h.p. Kinner radial air-cooled engine—except that it has a newly designed manually operated trailing edge flap gear of which no information is as yet available.

The entry by Ford-Leigh Safety Wing, Inc., is a Brunner-Winkle Bird two-seat open cockpit biplane with a 90 h.p. Curtiss OX-5 engine. It has a small auxiliary aerofoil along the leading edge of the top plane. The effect is similar to that of a slotted wing. But the auxiliary portion is somewhat larger than in the Handley Page, and it is set at a smaller negative angle to the main wing chord than is the section forward of the Handley Page slot when it is open. The Ford-Leigh auxiliary surface is, however, rigidly mounted and the slot is always open.

The entry of the Taylor Bros. Aircraft Corporation is a high-wing two-seat cabin monoplane with a 100 h.p. Kinner air-cooled radial engine and a variable-incidence device.

Of the Bourdon entry nothing is known except that it is a standard three-seat open-cockpit biplane with a 100 h.p. Kinner engine. Presumably it is fitted with some sort of safety device.

FUELS AND DOPES FOR AIRCRAFT ENGINES.

On Nov. 7 Dr. A. E. Dunstan lectured to the Royal Aeronautical Society on Fuel and Dopes for Aircraft Engines. At the opening of his paper Dr. Dunstan said that when he prepared his previous lecture six years ago there was a scare that the World supply of petrol was inadequate.

Since that time new fields have been discovered, new methods of prospecting have been evolved and a new technique of geophysics established. Refining is done with less waste, cracking is going to double supplies, and very large quantities of gasoline are now extracted from the formerly waste product, natural gas.

The present paper has been written with the sole object of emphasising the necessity for close co-operation and collaboration between the fuel producer and the engine designer.

Dr. Dunstan says that the engine designer demands various criteria for aviation spirit, only three of these are really of importance and these three are volatility, stability and anti-knock quality.

From the early days of aviation to the present time aviation fuel has been derived from carefully selected crude oils, but this cream of petroleum no longer suffices. The future of gasoline lies in cracking and the aero-engine will be compelled more and more to use cracked fuel, which has the disadvantage of being extremely gummy.

The general range of volatility of a spriit is judged by a distillation test which records the percentages distilling at intervals of 25 degrees Centigrade. The percentages distilling at 50 and 75 degrees give an indication of the amount of those volatile components which give easy starting and rapid acceleration from cold. The final boiling point shows to some extent the nature of the least readily volatile hydro-carbons present. The loss indicates the presence of hydro-carbons so extremely volatile that they may create gas-locks or boiling in the carburettor at high altitudes or tropical temperatures.

The specifications for the volatility of aviation spirit are going through the stages of modification that motor spirit underwent ten years ago. Modern specifications for aviation spirit have raised the final boiling point from 150 to 190 degrees Centigrade. There is however a safeguarding clause in the specification which ensures an ample supply of volatile components for ease of starting. An excess of these is guarded against to prevent premature boiling at altitude or at tropical temperatures.

As far as volatility is concerned aviation spirit need not differ appreciably from motor spirit and many aero-engines run quite effectively on No. 1 spirit. [The recent 600 hour test on the Gipsy engine was made entirely on No. 1.—ED.] Volatility is linked with anti-knock value. In a given petrol the higher boiling components have the lower anti-knock characteristics.

The physical stability demanded of an aviation fuel is that it should remain in the tanks as a homogeneous liquid and not gasify, freeze or separate into layers.

The demand for anti-knock qualities makes the addition of a large proportion of benzole necessary. As this solidifies a few degrees below 0 Cent., although petroleum spirit itself is immune from freezing, the addition of benzole increases the risk of freezing. This applies especially to high altitudes in Winter when the freezing limit of the petrol used must be between minus 40 and 50 deg. Cent. This limits the addition of commercial benzole to between 20 and 30 per cent.

There are various methods of solving the problem at the moment but they cannot be employed indefinitely. Benzole will have to be replaced as an anti-knock fuel by an alternative which will withstand low temperatures.

Separation into layers is a problem which only arises in fuels containing alcohol. All hydro-carbons are mutually miscible and when once mixed to a homogeneous fluid they will never separate.

Alcohol-benzole-petrol mixtures are likely to play an increasingly important part in the future, because they have most of the desirable qualities of aviation fuel and are effective at compression-ratios far beyond the range of any petrol-benzole mixture. Petrol and water-free alcohol are miscible in all proportions but separation into layers will occur at ordinary temperatures if the alcohol contains over 2 per cent. of water.

Unrefined benzole and unrefined cracked petroleum spirit contain substances which in contact with air become converted into non-volatile resins, causing these liquids to develop and deposit "gum" as it is called. The unrefined material may be treated with sulphuric acid or other suitable reagent and there redistilled. These processes will remove the gum-forming components and give a stable product. Complete removal of gum-forming components is never achieved and all samples of refined benzole and other cracked spirits slowly form gum if kept in store.

Engine design, the chemical nature of the fuel constituents, and the external atmospheric conditions, all influence the tendency of a fuel to detonate, pink or knock.

The lecturer is convinced that by suitable selection of the best degree of turbulence, the best bore-stroke ratio, the best sparking-plug position and, etc., straight petrol may be used at high compression ratios without pinking.

Broadly speaking, paraffin hydro-carbons detonate most readily, naphthenes and olefines at a higher compression ratio, while aromatic hydro-carbons preignite before they detonate. There are many exceptions to this generalisation. Up to the present anti-knock quality has been obtained by adding coal-tar benzole to the petroleum spirit.

Although cracked petroleum spirit is widely used for motor fuel, its use has so far been banned for aviation because, if inadequately refined, such spirit is liable to form resinous products in prolonged storage. This difficulty is now near solution and we may expect to find this new source of anti-knock fuel used in aviation spirit as soon as the authorities are satisfied as to its keeping qualities.

Petrol-benzole-alcohol mixtures have been used in engines at a compression ratio of even 12 to 1 with great success.

Ever since the importance of anti-knock quality was appreciated a method has been sought whereby this quality could be determined and expressed numerically.

The first method arose from the work of Ricardo who designed an engine with a variable compression head which could be adjusted while the engine was running. With this engine he determined the compression at which the power curve ceased to rise when the speed, load, temperature, ignition-setting, air-fuel ratio and other conditions were all defined. This compression ratio was known as the Highest Useful Compression Ratio of the fuel.

An alternative method is to match the fuel in an experimental engine against blends of two standard hydro-carbons, A and B of known purity, one being pro-knock and the other anti. The choice of these hydro-carbons is still difficult and under discussion.

The importance of standardising a procedure for testing fuels and expressing their anti-knock value is so widely recognised that steps are being taken in America to develop such a procedure.

There are only three criteria of fundamental importance in assessing aviation spirit and provided these are satisfactory there must be no reluctance to draw supplies of fuel from a much wider range of sources than merely petroleum spirit and benzole.

Dr. Dunstan concluded his paper by saying that if real and rapid progress is to be achieved there must be clear collaboration and interchange of ideas between the producer of the fuel and the designer of the engine.

DR. THOLE, joint editor of the paper, spoke for a few minutes and said that the principal object of the paper was to promote a good discussion. He emphasised the need for co-operation between the engine-designer and the oil-engineer. Engine designers produced an engine and then expected the oil engineer to provide a suitable fuel which might be impossible. Recently there has been more co-operation.

Slides were then shown of the Armstrong test engine, which Dr Thole says is cheap to make, simple in construction, and accurate. It incorporates points which are of fundamental importance in a test engine. The controls are simple, the ratio of air and fuel is adjustable (there is no float chamber, as the fuel is supplied direct to an adjustable jet from a flow-meter). The compression ratio is adjustable up to 8 to 1, the cylinder capacity is 370 c.c. A bouncing pin is used to indicate the beginning and intensity of detonation by means of amperemeter and voltmeter. The readings are not dependent on audition. [Presumably the speaker meant "hearing."—C. G. G.]

THE CHAIRMAN, COL. THE MASTER OF SEMPILL, thanking the lecturers and opening the discussion, said that Drs. Dunstan and Thole have collaborated for 20 years. He pointed out that cracked spirit is not as yet accepted by the Air Ministry and that Dr. Dunstan remarked that he is not giving much attention to compression-ignition engines. The chairman said that in view of recent accidents a change of fuel is very desirable for safety as well as economy. He wished to know whether a change of fuel would alter the economic balance of supplies. He considered the bouncing pin to be a great improvement as Mr. Ricardo relied on aural detection of detonation. He then called on Mr. W. R. Pye to open the discussion.

MR. PYE said that he was invited to ask some questions and was not prepared to open the discussion. He said that the Oil firms' financial stability makes them monuments of prosperity, and hence they are able to carry on research. "To him that hath shall more be given" is a most unfair law, which holds in research as well as other things. Dr Dunstan had spoken of three things—Volatility, Stability, and Detonation. Regarding detonation the desirability of co-operating with the engine-designer does not carry one very far because when the engine-

designer has done his best it is always up to the fuel manufacturer to produce better fuel so that the engine-designer can raise his compression still higher. He, Mr. Pye, was surprised that Dr. Dunstan thinks that our salvation lies in cracked and purified spirit and wished to ask the lecturer whether he can produce sufficiently purified spirit at a competitive price. Dr. Dunstan had said very little about dopes. The history of Lead Tetra-ethyl as a dope was romantic,—it was introduced into some petrol which was destined for use in German Submarines, with the idea that such horrid stuff would be sure to spoil the engines, but subsequent test showed it to be the best anti-knock dope, and nothing has been discovered since on either side of the Atlantic which is so good. He considered that there is need for a better dope than lead tetra-ethyl, one that is better for the engine and non-poisonous, and that improvement in dope should be attempted as distinct from improvements in fuels.

MR. FORD said that aero-engine design can be improved in induction and turbulence. He was disappointed that no stress was laid on low-temperature carbonisation of coal to produce fuel, as that is of national importance. He remarked that the lecturer stated that where the maximum volumetric efficiency was required the induced gases should be as cold as practicable, distribution is more important than volumetric efficiency, and that means artificial heating, hence the importance of volatility. He thought that the engine-designer and fuel-producer should co-operate for better distribution. Owing to crashes happening owing to freezing of the benzol content of fuels it is important to find a substitute for benzol. He expressed surprise that the lecturer recommended Alcohol-Benzol-Petrol mixtures. However good results may be obtained on the ground with this mixture with high compression engines, it will remain too heavy to use in the air owing to the low calorific value of alcohol.

WING CDR. HYNES said that good distribution requires volatility, and in spite of great effort to reduce weight, a multi-cylinder engine only gives about 90% of the power obtained from a single cylinder, owing largely to distribution troubles. And anything which tends to make this more difficult must be avoided. The speaker was surprised that Dr. Dunstan was so optimistic about producing a non-detonating dope-free spirit and would like to know if he had produced any, even as a laboratory experiment.

The inspection of petrol has great difficulties and the tendency towards placing anti-knock values as the chief consideration was appreciated because it simplified inspection. He would like to know whether standard fuel remains relatively the same in different engines. He said that the designer is already tied up in knots on the mechanical design and that cylinder-heads are generally determined by the mechanical design.

MR. TAYLOR questioned the accuracy of tests on an engine (the Armstrong test engine) with plain crankshaft bearings, as the higher friction-losses tend to inaccurate tests, and although ideal for lubricating oil tests, were not so good for fuel tests. He said that some people say of the compression-ignition engine that fire-risks do not matter, and that it is only the economy that is important. The speaker did not agree but he wanted to know whether the fact that petrol was not used would reduce its price to such a figure that it would pay better to use petrol than oil. When the compression-ignition engine comes to the fore a new form of fuel-dope will be required to accelerate combustion or detonation. Has Dr. Dunstan information on such a dope?

MR. EVANS mentioned the historical point of view. For 50 years engine designers have been troubled with detonation and have found that the only method of eliminating it is the Diesel engine. It still seems to press the oil engineer and engine designer very hard, but there is still the solution in the Diesel engine. As regards the supplies of fuel-oil, a motor-ship uses as much oil in a day as a motor-'bus would use in three years.

MR. BRAMSON asked for a simple definition as to what happens during detonation. Is the loss of power due to extremely high temperatures? He also wanted to know whether anything similar happened in compression-ignition engines, and wanted to know the relation between flash-point and fire-danger.

MR. STANSFIELD (engine-test laboratory of the Anglo-Persian Oil Co.) said that in reply to the question on the use of standard fuels in various engines, if the reference fuels are pure tests can be brought to within 2% or 3%. The Armstrong engine has plain bearings because it was designed to be cheap and to be used by unskilled labour. The crankcase has a capacity of only one litre with splash-lubrication which results in very small changes in temperature, about one degree in a three-hour test. The bouncing pin is not so sensitive as the R.A.E. test-apparatus, but it gives good comparative results.

In asking the Lecturer to reply, Col. Sempill said that the Society had the honour of having the President of the Institute of Technologists as the lecturer, and asked about the supply of fuel-oil if petrol was no longer used for aircraft and cars.

The Lecturer in reply said that the paper was prepared at short notice after the title had been announced, otherwise "dope" would have been dropped from the title. He said that the oil chemist can turn light oils into heavy oils. As regards cracked oil to satisfy the Air Ministry, it depends on what was wanted. The total amount of coal treated by the low-temperature carbonisation process is about 100 tons a day, a small percentage of which weight is produced as oil, so the supply is not important when the quantity of petrol imported in a year is 800,000,000 gals. Cracked spirit is superior to benzol except for gum. The Ricardo Head is the result of collaboration between designer and fuel-engineer. He refused to be drawn into the question on prices. According to Professor Wheeler, where there is detonation there is an after-burning which causes loss of power. The higher the flash-point the greater the risk, but the fires in the works in Persia happen with paraffin because at high temperatures gasoline makes a mixture which is too rich to ignite.

THE INSPECTION OF METALS.

On Nov. 21 Mr. L. W. Johnson read his paper on the Inspection of Metals and their Alloys before a joint meeting of the Institution of Automobile Engineers and the Royal Aeronautical Society at the Royal Society of Arts.

This lecture was held at 7.45 p.m. instead of the more usual 6.30 p.m. and members of the Royal Aeronautical Society who arrived at 7.15 to obtain light refreshments found the cupboard was bare. The light refreshments (which, incidentally, are supplied by the wealthy motor-makers) were dispensed afterwards. One would have thought nourishment was needed before, not afterwards. Anyway "light refreshment" seemed a bit inadequate, and the writer had dinner first so he was prepared

Mr. Johnson's paper was full of the most interesting information and in fact was so voluminous that the author made no attempt to read right through it. He contented himself with explaining the slides.

It is not possible to do justice to the paper in a report of this kind nor to quote all the practical information contained in the appendices. One can only advise people who are interested, and every member of any inspection staff should be numbered amongst these, to get a copy.

As Professor Morgan, the chairman of the Institution, was unable to arrive in time, Col. The Master of Sempill deputised and introduced Mr. Johnson, who, so we were told, after four or five years' work with Prof. Aitchieson joined Mr. Fedden and is now metallurgist to the Bristol Co.

MR. JOHNSON said he did not propose to deal in detail with tensile tests. He commented on the fact that the ratio of gauge-length to diameter was important.

Referring to Yield Point the lecturer said that whereas this was easily determinable for mild steel it was difficult to find for a hardened and tempered alloy steel, and as a result, two different operators working the same machine could obtain results differing by at least 5 tons per sq. in. for the same steel.

As the Yield Point does not really exist in certain hardened and tempered steels, cast alloys, cold worked steels and alloys, Proof Stress is being used to replace it.

Proof Stress may be defined as the load which will produce a permanent extension of not more than .1 per cent. of the gauge-length. For non-ferrous materials a permanent extension of .5 per cent. is also used.

The lecturer then passed on to the Brinell Test, which is described in the paper as being performed by pressing a hardened steel ball into the material under a definite load. The Brinell Hardness Number is obtained by dividing the load in kilogrammes by the area in millimetres of the spherical surface of the impression.

Considerable variation of Hardness Number is obtained by varying the load, and the large diameter (10 mm.) of the steel ball used makes a big enough impression to make this method of testing not always suitable.

Mr. Johnson then showed a number of slides illustrating various testing machines using modifications of the Brinell Test.

The Firth Hardometer is a very compact machine and uses a 120 kg weight with 2 mm., and 4 mm. balls for testing steels, and a 30 kg weight with 1 mm. and 2 mm. balls for testing non-ferrous materials.

This machine, which is chiefly suitable for finished and partly finished machined articles, will test at the rate of about 200 articles per hour.

The Vickers Pyramid Hardness Testing Machine though elaborate is probably the most accurate of all the small impression types.

Another well-known machine is the Rockwell from which the direct hardness number is obtained by direct reading from a clock indicator with two scales. Before the clock indicator is set to zero an initial load of 10 kg. is applied to the specimen.

There is also the Herbert Pendulum Hardness Tester and the Shore Scleroscope Hardness Tester which obtains a Hardness Number by recording the height of rebound of a small steel drop-hammer.

Mr. Johnson showed a slide of the Herbert "Cloudburst" Hardness Tester which affords the only logical means of testing case-hardened steel. In this instrument the case-hardened surface is subjected to a continuous bombardment by steel balls, all dropped from a definite height and covering the whole surface to be tested. Any soft patches will be revealed by a roughening of the surface. Batches of the same parts may be tested at once in this machine and no measurements are needed to interpret the results.

A useful test consists of passing a magnetic current through an iron or steel specimen. The presence of a crack lying more or less across the path of the current will cause magnetic poles to appear at each side of the crack. The specimen after magnetising is flooded with kerosene containing a quantity of soft iron dust in a very fine state of division. This dust adheres to the poles formed at each side of the crack. Mr. Johnson remarks that parts should be demagnetised after this test as magnetic components are not welcome inside engines.

A method of magnetic analysis has been developed in the United States. In this method of test the bar is slowly passed through coils and after suitable sorting and filtration its magnetic characteristics are reproduced on an oscillograph. A steel of any given chemical composition gives a fundamental wave form in an oscillogram upon which strains, decarburisation, surface defects and inclusions will be superimposed.

Surface defects are liable to be hidden by scale or rust on hot-worked materials and by a very thin "flowed" surface layer on cold worked or machined materials. These defects can be revealed by removing the surface coverings.

For rough stampings the reagents can be fairly vigorous and the process is called pickling. For finished parts no measurable quantity of metal is removed and the process is known as "etching."

The lecturer showed a very interesting slide illustrating the value

of etching. A tap had broken in a hole in a nickel-chromium steel part and the fitter in all innocence had applied a blowpipe with the idea of softening the tap and then drilling it out. This proved impossible as did an attempt to trepan.

Etching showed that the blow pipe had heated the steel above its hardening temperature and on withdrawing the flame the large amount of cold steel had quenched the hot area giving it a tensile strength of about 100 tons.

Sulphur printing may be used to trace the sulphur distribution in steels, excepting the high chromium stainless group. Bromide printing paper, soaked in a 5 per cent. sulphuric acid solution is placed in contact with the polished surface for five minutes. The print is finished by fixing and washing in the usual way.

The grain flow must be the best available in important forgings and this can be ascertained by macro-etching. Roughly this form of etching consists in polishing the surface with No. 0 or No. 1 emery and being careful that each successive direction of polish is at right angles to the last. The surface is thoroughly freed from grease and etched in 10 per cent. nitric acid. A better method is that due to J. C. W. Humphrey.

Mr. Johnson next outlined the origin of defects in steels and traced their development from the ingot stage. Following on this came the advantage of forming gear blanks by up-ending.

Sandblasting and pickling are the most satisfactory methods of inspecting welds, but cannot be relied on to show up internal defects. The preferable way of checking welds is to take check welds at irregular intervals and submit these to tensile, bend and microscopical tests.

Mr. Johnson closes his paper with the plea that whereas in the past the inspection of raw materials had been considered a thing that a labourer could do, the time had come for the raw-material inspection staff to be composed of highly-trained men with a status equal to that of the "Finish View."

DISCUSSION.

DR. MORGAN, who is President of the Institution of Automobile Engineers, then called upon Dr. Gutteridge, the President of the Institution of Engineering Inspection, to open the discussion.

One would here interpolate that the Automobile Engineers have an excellent custom of calling speakers in a discussion to the dais, which makes it much easier for them to be heard by the audience, who are often quite unaware of what members and others are saying in discussions at meetings of the Royal Aeronautical Society.

DR. GUTTERIDGE stressed the point that, as the cost of a part grows with each successive step in the work done upon it, frequent inspection becomes more valuable. It is most important to reject faulty parts in the early stages. There were three potential sources of trouble—design errors, faulty material and incorrect machining.

WING CDR. G. B. HYNES, D.S.O., who is Chief Inspector (Engines) in the A.I.D., explained that he felt somewhat of an impostor as he had not had time to read the paper beforehand. He said the lecturer had taken a somewhat different line to what he had expected. Mr. Johnson had dealt more with the methods employed than the whole process. He (Wing Cdr. Hynes) referred to the fact that the British Inspection System as developed by the Air Ministry had been and still was being widely copied throughout the world. He said that from the aircraft viewpoint a rigid control of material *ab initio* was absolutely necessary. He agreed that the inspection of raw material needed a well-trained staff.

MR. SUTTON agreed. He found in magnetic analysis that longitudinal cracks were very difficult to find unless the field was applied transversely. Mr. Sutton also referred to the use of ferric chloride and cupric chloride as a useful etching reagent for use in the inspection of wire.

MR. WILLSMITH (or Woodsmith) said that applying colour bands transversely to bars for identification purposes in stores was no good as such bands became mutilated when the bars were sawn. [One has always seen bars painted longitudinally for this very reason.—ED.] He asked for information about the etching of welds. He also said that chromium plating (used to prevent corrosion) had proved very useful to indicate defects.

MR. DAVY referred to the inspection methods used at the Welsh steel works and said it was impossible to inspect every billet as cast. The only possible method was to select a certain percentage. Referring to the impossibility of rolling to specification, he said that those who drew the specifications did not have to pay for the material produced to meet them.

ADMIRAL HEPPEL said that tests could be divided into several groups. There were tests for the guidance of manufacturers such as etching tests made on crankshafts and gears which once made need not be repeated. There were tests during production on standard parts and there were tests to destruction which he considered essential. He asked whether every valve was etched at Bristol.

Another speaker wondered whether it was not possible by certain general tests to find out whether a material was suitable for any particular design.

MR. DEVEREUX emphasised the importance of early testing and explained how the etching of a particular drop forging immediately after production had saved a large amount of scrap. The firm to whom these forgings were being supplied had stipulated that the "flash" should be at a certain place. Etching showed that as a result the grain flow was incorrect and the forging would fracture at the most highly stressed part. Arranging for the "flash" to come elsewhere completely obviated this difficulty.

MR. HATFORTH quoted figures to show that there was no reason for discrepancy between Yield Point figures. He pointed out that careless grinding of air-hardening steel could cause local hardening. He inquired as to a suitable method for determining the hardness of high-speed cutters.

Another speaker referred to the errors brought about by the inclusion of gas in chill-cast test-bars. [B.E.S.A. have been conducting tests for a long time in the best method of employing sand-cast test-bars.—ED.]

MR. HAWKINS, of the Institute of Testing, referred to a method, employed at Woolwich, of putting specimens under specified yield-point stress for 10 secs. and then releasing, after which the specimen was tested for elongation.

MR. JOHNSON, in reply, said he appreciated the point raised by Wing Cdr. Hynes, but he felt that the A.I.D. system was sufficiently well known and so he devoted himself to actual methods of testing.

He thought that the time for employing X-rays was not yet ripe and that etching was more satisfactory than magnetic methods of analysis. He agreed that longitudinal cracks were difficult to observe by magnetic analysis. The etching of welds was difficult and could be applied to suspected spots only.

All valves, gudgeon-pins, and connecting rods were etched at Bristol. Pratt and Whitney were using these Bristol methods of inspection in spite of the fact that Pratt and Whitney were producing 250 engines a month.

There was an increasing tendency to dispense with the determination of Yield Point and define it as a certain proportion of the maximum stress.

THE BEST BOOK YET ON AERO-ENGINES.

[*Modern Aviation Engines.* In Two volumes. By Major Victor Pagé, Air Corps, U.S.R. 1908 pages. Fully illustrated with photographs and line drawings. Chapman and Hall Ltd. Supplied by THE AEROPLANE Book Department, Cannon House, Pilgrim Street, E.C.4. 45s. complete,—or volumes sold separately at 25s. per volume.

Information on aero-engines, the theory of their design, the materials of which they are made, their constructional details, installation, running repairs, overhaul, and reconditioning, has been available, for some years, spread over many books, some of which are Government publications or, otherwise not available to the general reader. This has now been collected into one book, by Major Victor Pagé, of the U.S. Army Air Corps Reserve.

An introduction briefly reviews the history of the internal combustion engine, and describes the leading European aero-engines of the pre-1910 types together with two early American engines.

The fixed radial of Charles M. Manley which was made for the Langley "Aerodrome" had many up-to-date features and was the first American aero-engine. The second was the well-known four-cylinder Wright engine of 1903.

A long extract from THE AEROPLANE on the horse-power required for flight, together with an outline of the leading types of aircraft shows that the author considers the engine in relation to the work that it has to do, and avoids the fault which is unfortunately only too frequent, of the engine enthusiast forgetting that the engine has to be considered as an integral part of the aircraft and not as a thing by itself —The number of engine firms who now design cowling to suit their own engines show that this faulty outlook is being corrected.

Elementary heat theories and thermodynamics are explained very simply. The application of theory to the leading types of four-cycle, two-cycle, compression-ignition and Diesel engines is as full as possible without mathematical difficulties. The mathematics used in the book is confined to simple algebra and arithmetic. In spite of this it covers all the essential points of the theory of heat engines for those who are users and not designers of engines.

The problems arising from the use of various fuels and anti-knock dopes are considered, and the history and manufacture of Blau gas will be new to many.

The leading types of carburetters in use on both sides of the Atlantic are dealt with historically, and, in their present form, with instructions for adjusting and tuning. Magnetos, starters and other auxiliaries have their sections.

The installation of engines is dealt with for each engine individually. In all, over 50 modern aero-engines have a place in the book, with such extracts from the makers' handbook and additional information as may be necessary for installation, maintenance, overhaul, or reconditioning. In many cases the tools required, methods of doing the work and specification of materials required are also given.

The general interest of the book is greatly increased by the arrangement of each section. In almost every section the history and development of the component is given with illustrations of early forms, followed by the general theory and the development of the forms in general use. For this reason the book is of use to would-be inventors, who, by reading the development of the component parts, can avoid protecting inventions which have already been tried out and found unsatisfactory.

Critically one wonders why so much space has been given to the Fairchild-Caminez engine which has now been withdrawn from production. Several unusual types of engines are described including twin-crankshaft and barrel types.

The fact—which is not generally realised—that high-speed Diesel engines are not true Diesel engines—is explained. The indicator diagram of such dual-cycle engines are more like the diagrams of the constant-volume cycle than that of the constant pressure. This dual-cycle is the result of attempts to raise the low b.m.e.p. and slow speed of the Diesel to a value comparable with the standard type of electric-ignition engine. Several of these dual-cycle engines are described.

This book will be of great use to private owners of aircraft, ground-engineers, draughtsmen, and even motor-car owners who want to know why.—L. H. F.

The DESOUTTER

"The ideal Light Aeroplane."

"A thoroughly reliable, sound and practical vehicle of the air, for the extremely low price of £795."—*The Times.*

AIR LUXURY.

"MR. DESOUTTER, who is a pilot of pre-war days, ... produced a thoroughly reliable, sound, and practical vehicle of the air for the extremely low price of £795 . . . . . The Desoutter . . . . . with two passengers, pilot, and a moderate amount of luggage, has a duration of three and a half hours at a cruising speed of 96-98 miles an hour, with a top speed of 110-114 m.p.h. It owes its performance partly to its extremely clean design, and also to the step-up in power given by the new Cirrus-Hermes engine of 105-115 h.p. Undoubtedly it will make a big appeal to the seasoned private owner, who is always wanting more speed than the light aircraft can provide with the 90-100 h.p. engine. Thus National Flying Services will be able to offer their clients who wish to fly about the country on business a cruising speed practically the same as that of the big air liners, with, of course, very much lower maintenance costs, and, therefore, cheaper fare rates. . . . . .

ALL ENCLOSED CABIN.

. . . . I proved by personal experience that the passengers have a very fine unrestricted view of the countryside, while my pilot showed that the machine not only takes off very quickly and climbs with a good reserve of power, but also manœuvres easily and lands very nicely. It is easy to step into the cabin direct from the ground, but the main charm of the all-enclosed cabin with the pilot in the same compartment is the intelligent interest the passenger can take in the flying side of the trip. He can watch all the instruments just as the pilot can, noting speed, height, direction and engine revolutions, a thing impossible in the tandem cockpit machine without duplicate instruments. Instead of using a clumsy speaking tube, and therefore remaining more or less cut off from the man in the other cockpit, the passengers can lean forward and converse with the pilot, suggest when to turn and when to look for any particular point, and ask about all the little points of interest which crop up in an air journey, and, above all, there is that pleasant feeling of companionship which should be one of the delights of all travel "

A REVOLUTION IN METALLIC DESIGN.

When The Aeroplane of March 20, 1929, announced the formation of the Compagnie Lepère-Weymann a comment was added to the effect that something interesting was to be expected from such a combination.

The first product of this new firm is extraordinarily interesting both as to general layout and various structural novelties. This new machine is a two-seat reconnaissance monoplane known as the W.E.L.10.

The designer, Capt. G. Lepère, was a member of the French Mission which went to the U.S.A. in 1917 when America entered the War.

One of the results of his activities at McCook Field, Dayton, Ohio, was a two-seat reconnaissance biplane with a Liberty engine. Large quantities of this type were ordered just before the Armistice only to be cancelled on the cessation of hostilities. In May, 1924, a machine of this type flown by Lieut. J. A. Macready put up a World's Height Record of 32,239 ft.

On his return to France Capt. Lepère joined the aviation branch of the great French armament concern known as the Etablissements Schneider. In 1926 this branch was formed into a separate company with the name Avimeta. This company was forced to close down in 1928 owing to lack of official encouragement.

In the two years of its existence the company produced two very interesting all-metal commercial aircraft, one a single-engined cabin monoplane on the lines of the Ryan monoplane, and the other a three-engined commercial monoplane reminiscent of the three-engined Fokker.

The other member of the firm is Mr. Charles Weymann, who is a French-Haitian by birth and was one of the earliest and finest pilots in France. In 1911 he won for America the Gordon-Bennett Race at Eastchurch while flying a Nieuport monoplane.

During the War 1914-18 he built aero-engines near Paris. Since then the name Weymann has become famous all over the World as a result of his characteristic design of motor-car body, which resembles aircraft practice in that it uses a light wood framework covered with fabric.

The W.E.L.-10 has been designed firstly to obtain a really sound machine from the aerodynamic standpoint, and secondly, to obtain a machine which can be manufactured quickly and easily in quantity.

The first object has been gained by using a high-wing monoplane with only a single bracing strut, by fitting an engine of extremely small frontal area like the 630 h.p. Hispano-Suiza, which further allows a fuselage with a small cross-sectional area, and by using a cantilever tail.

The second object has been gained by the development of new methods of construction employing a stressed skin as wing, control surface, and fuselage covering and by standardising a number of similar components. This will be explained in further detail in the description of each component.

The Lepère-Weymann W.E.L.-10 reconnaissance monoplane.

For ease of transport and repair the W.E.L.-10 can be taken apart into a number of pieces. The wing is in five parts, and the fuselage in three.

The following details are taken from *L'Aéronautique*:

A special aerofoil section, known as the Lepère No. 8, is used for the wing in which the centre of pressure is situated at about 35 per cent. of the chord from the leading edge. This aerofoil section has an L/D ratio comparable to those of the best-known sections. The wing has an aspect ratio of 6.7 and is of constant chord and thickness save at the ends, which taper quickly both in thickness and chord.

Owing to the stationary C.P. and the stressed wing covering a single spar only is used—this spar is divided, like the wing, into five sections. Essentially, this spar has extruded duralumin flanges of "T" section. The leg or trunk of the "T" is sandwiched between two duralumin plates forming the webs. In places these webs are corrugated vertically. Additional stiffness is given to the spar by extra laminations placed along the flanges.

The bracing strut fittings on the spar are very simple, and consist solely of turned bosses through which a pin is placed when the forks of the bracing struts are in position. These bosses are bolted to the webs of the spar.

The centre-section of the wing is specially designed to take the radiator which is carried in a slot 1.40 m. (4 ft. 7½ in.) long behind the main spar. Extensive wind-tunnel tests have shown that this

The location of the radiator in a slot in the centre-section.

slot in no way detracts from the lift of the wing, nor does it increase the drag. In fact, the makers claim that the position of this slot in the centre-section over the fuselage helps to decrease the interference effect between the wing and the fuselage.

The wing is supported above the fuselage by outwardly-splayed "N" struts to the extremities of the centre-section. The outer portions of the wings are braced by single struts, one on each side. These principal struts are made of streamline duralumin tube with an adjustable fork at the wing attachment end.

With the exception of the wing-tips, each portion of the wing is made by sliding half a dozen previously assembled standard sections on to the spar and joining them up.

The standard section is made by joining up a number of narrow duralumin strips which run parallel to the spar. Each strip has a

The Lepère-Weymann method of building up a standard wing section.

trough folded along one edge. This trough is placed projecting inside the section and is lap-jointed to the next band and rivetted on both sides of the trough. As can be seen from the drawing, this method gives a number of stiffeners running parallel to the spar.

A specially drawn channel is rivetted inside the section at top and bottom to accommodate the spar, the flanges of which slide in the channels.

An inverted Vee channel is placed right round the centre of the section, in the direction of motion, to give further stiffness.

Each section is closed with a diaphragm at each end which has openings for the spar. These diaphragms take the place of the normal ribs and are attached to the sections by being rivetted to external angles rivetted to the edges of the sections. The rear edge of the standard section is closed with a channel which forms a secondary spar and gives a fulcrum for the aileron hinges.

The sections slide onto the spar and are fixed thereto with angle-plates rivetted to the diaphragms or ribs. Then the previously mentioned angles and diaphragms are punched and eyeletted together. [This is reminiscent of the Wibault system.—T. J.] The leading edge and trailing edge of lighter construction are then added to the wing.

The ailerons of high aspect ratio (5.40 m. x .30 m. equals 17 ft. 8½ in. x by 1 ft. 0 in.), have 16 deg. of travel, and extend along the whole of the trailing-edge of the main portions of the wing, that is along the whole of the wing excluding the wing tips and the centre-section. To the writer the method employed in the construction of ailerons seems heavy. This method employs duralumin sheet rivetted to a tubular spar which forms the front edge of the aileron, and is also rivetted along the trailing edge with a closing strip. There is also an intermediate internal longitudinal spar and outside fore and aft angle stiffeners.

The fuselage is made in three portions, each of which are sub-assemblies put together on jigs.

The front portion forms the detachable engine-mounting and is attached at four points to the centre portion of the fuselage.

The central portion forms the attachment for the wing bracing

The Vickers-Reid Control Indicator

An essential instrument for flying in conditions of poor visibility.

Captain C. D. Barnard, who in seven days with Her Grace The Duchess of Bedford, recently flew from England to India (Karachi) and back writes :—

"**The Reid Control Indicator was invaluable** - especially considering the fact that a great deal of **the journey was flown in clouds or in dust storms. It worked perfectly** and I should insist upon a 'Reid' being fitted to any machine if I were to contemplate a similar flight on it."

August 17th, 1929.

The Lepère-Weymann method of fuselage construction.

struts, the undercarriage, and, in addition to accommodating the crew, it also contains the fuel tanks. A method similar to the wing construction is used for this and the rear section of the fuselage. Longerons are formed by making semi-circular grooves in the four corners of the fuselage covering and closing them with angle sections. Unlike the wings, the grooves in the bands forming the covering are placed externally and run parallel to the longerons. Internal bulkheads built up of duralumin channels increase the rigidity of the fuselage.

The tail portion is similar in structure to the central part, and finishes in a vertical rudder-post.

The tail-unit is of the normal monoplane type, but is cantilever throughout. The tail-plane has a swept-back leading-edge and is built in a similar way to the wing.

Its leading edge is hinged to the top of the fuselage for adjustment in the air. The incidence is varied by links and a bell-crank. The elevators are made in two identical and interchangeable pieces. The fin can be adjusted on the ground. The rudder is balanced.

The undercarriage is of the divided type and has a wide track (2.40 m. equals 7 ft. 10½ in.). Wheel brakes are fitted. The axles are hinged to the fuselage at the wing-bracing strut-fittings. The radius rods slope forward to the fuselage and the vertical shock-absorbers of the oleo-pneumatic type are attached to the wing bracing struts. Three further struts on each side brace this point, one vertically to the wing spar and two to the upper fuselage-longeron. The tail-skid is of the leaf-spring type.

The engine is a 630 h.p. Hispano-Suiza 12-cylinder water-cooled Vee, completely encowled. The radiator is mounted in a slot in the centre-section, and the fuel is carried in the fuselage.

The crew are accommodated in two tandem cockpits, the pilot underneath a cut-out in the trailing edge and the observer further aft. The armament consists of two fixed Vickers guns in the engine cowling firing through the airscrew, twin Lewis guns on a Scarff mounting over the rear cockpit, and one further Lewis gun mounted in the floor of the rear cockpit and firing aft under the tail.

Dual control is fitted. The control unit is made as a complete sub-assembly and can be removed by unfastening a few bolts.

Dimensions.—Span 15 m. (49 ft. 2½ in.), Length 11.50 m. (37 ft. 9 in.); Height 3.10 m. (10 ft. 2 in.); Wing area 33.75 sq. m (364 sq. ft.).

Weights and Performance.—No data available.

PROGRESS IN NIGHT FLYING.

A really good scheme for assisting night landings and at the same time doing away with the necessity of keeping the aerodrome brilliantly lit, has been developed by the famous Spanish firm of S. Sánchez Quiñones. By this scheme any pilot anxious to land at night, can turn on the flood-lights, boundary lights, and obstruction lights of his landing ground, by the simple expedient of first dropping a flare.

The flare is dropped from a height of between 600 and 1,000 feet over a triangle of coloured lights on the ground. Inside this triangle is a concrete pillar about three feet high on the top of which is a photo-electric cell encased by a cover made of a special non-absorbent glass. This electric cell is so sensitive that the dropping of a flare within 200 feet will cause the cell to work.

The illumination of the photo-electric cell allows a .0000001 ampère current to pass, and this minute increase operates a luminous micro-relay which in turn works a mechanical relay. This works a power relay, which allows a current of 400 ampères to pass through the aerodrome lighting circuit, thus illuminating the whole place.

The whole apparatus is so arranged that, once lit, it so remains, until extinguished by the pressing of a push-button—which turns off the lighting current and resets the relay.

The necessary current required to operate the relay is obtained from a dry battery of 200 volts 1 ampère capacity. The power-relay and the current for lighting the aerodrome are taken from the local supply.

Mr. R. North, who lives at 42, Abinger Road, Bedford Park, London, W.4, and is the London Manager of S. Sánchez Quiñones, would be very glad to discuss this system with anybody who is interested. The patent for this country is open for negotiation.

THE GLIDING MOVEMENT.

THE GLIDING LUNCH.

About thirty people have already written to THE AEROPLANE and avowed their intention of attending the Gliding Lunch, which will therefore be held at The Comedy Restaurant, 38, Panton Street, Haymarket.

The date is Wednesday, Dec. 4, and the time 1 p.m. The cost of the lunch will be 4s. per head, exclusive of drinks. Those intending to be present should make a point of arriving well on time, as lots of us have offices to which we must return.

All others who have not already written will be welcome.

There will be nothing formal about the lunch and no attempt will be made to form an association or anything of that sort. The idea simply is to get people together for a start.

SOMETHING TANGIBLE.

The well-known German firm the Kegel-Flugzeugbau of Kassel, have sent this office a catalogue of their gliders together with prices. The firm must be congratulated on following modern trends so closely. As a result of their enterprise, gliding enthusiasts can now be told something about the cost of various glider types.

One must point out that the Kegel-Flugzeugbau is a firm of repute, as is shown by the fact that all the World's gliding records are held by machines built by them.

This firm makes a range of machines from the single-seater Zogling, costing 950 marks (£43), to sail-planes, like the Kegel III, costing 4,200 marks (£210). This machine can be supplied with a wheel undercarriage, so that it may be towed off the ground behind aeroplanes.

The Zogling is a glider of the type illustrated on the front cover of the Gliding Issue of THE AEROPLANE. This machine has a span of 10 m. (34 ft. 8½ ins.) and a wing area of 15.88 sq. m. (171 sq. ft.). As it weighs 85 kgs. (187 lbs.) empty, if one assumes a pilot weighing 77 kgs. (170 lbs.) the loaded weight would be 162 kgs. (357 lbs.).

The wing loading is 10.2 kg./sq. m. (2.16 lbs./sq. ft.). The flying speed is given as 12.5 m./sec. (41 ft./sec.), and the gliding angle 11 to 1.

The KFK.3, which is a two-seater, costs 3,300 marks (£165). This machine is a braced high-wing monoplane with fuselage. The span is 15.500 m. (50 ft. 10 ins.). The wing area is 27 sq. m. (291 sq. ft.). Weight empty, 182 kgs. (400 lbs.). Flying speed 14.1 m./sec. (46.3 ft./sec.). Gliding angle 17.5 to 1. Sinking speed .86 m./sec. (2.82 ft./sec.).

Some details of the real sailplanes will be found under separate headings, but this will suffice to show what can be bought in Germany.

Those who are interested should write to the Kegel-Flugzeugbau Kassel, at Ihringshausen bei Kassel, Germany, and mention THE AEROPLANE.

THE RECORD BREAKER.

A number of remarkable gliding flights have been made this year by Robert Kronfeld on his glider, the *Wien*. In fact, this pilot and machine hold the various records. These are a storm-soaring flight over 143 km. (89 miles), with an altitude of 2,050 metres (6,720 ft.) over the starting point and another flight over 150 km. (93 miles), with 2,160 m. (7,080 ft.) altitude over the starting point.

The *Wien* was designed by Alexander Lippish, of the Rhön-Rossitten Gesellschaft, H. Jakobs and Emil Polsonile. It was built by the Kegel-Flugzeugbau Kassel.

The ailerons are unbalanced. There is a fin and no fixed tailplane but balanced elevators are used instead.

The wing span is 19.15 m. (62 ft. 10 ins.). Length, 7.83 m. (25 ft. 10 ins.). Wing area, 20.2 sq. m. (217.5 sq. ft.). Weight, empty, 165 kg. (364 lbs.). Weight, loaded, 240 kgs. (529 lbs.). Gliding angle, 1 in 24. Minimum sinking speed .50 m./sec. (1.64 ft./sec.).

THE AMERICAN RECORD HOLDER.

The American National Gliding Association have produced a glider on which Dr. Wolfgang Klemperer, a director of the association, covered 15¾ miles in the Allegheny Mountains on Oct. 7 of this year. The time was about 1 hr. 40 min.

This glider is known as the Akron-Condor and was designed by Frank Gross, late of Darmstadt University. The constructors were the Baker-McMillen Co., of Akron, Ohio.

The Condor has a span of 53 ft. (16.1 m.), length 18 ft. 4 in. (5.59 m.), a maximum chord of 4 ft. (1.22 m.), aspect ratio of 20:1. Weight empty, 304 lbs. (138 kgs.). Gliding angle 1:24. Sinking velocity of 2 ft. per sec.

GLIDING NOTES.

Mr. Masami Ono, a Japanese aeronautical engineer who is at present studying aeronautical construction at the Rochester Works of Short Bros., is anxious to get in touch with gliding enthusiasts.

Mr. C. H. Lowe Wylde, whose address is Fernleigh, Rochester Street, Chatham, has a monoplane glider which is nearly new. He is willing to sell it for £20.

REYNOLDS

Evidence of high standard of our Aircraft Tubing is shown by its extensive use by the leading Aircraft Constructors.

Reynolds Tubes are manufactured to all specifications in any of the following forms:

Round and Special Sections.
Taper Gauge for Axles, etc.
Manipulated Tubes of all descriptions including Built-up Components (Welded).

Anything in Steel Tubing for Aircraft.

REYNOLDS TUBE CO., LTD.,
HAY HALL WORKS, TYSELEY,
BIRMINGHAM.

AIRCRAFT TUBING

R.H.S.

Re-charge without dismantling!

The TECALEMIT

SPRING FEED LUBRICATOR

Capacity-2 ozs. Rate of flow adjustable for 50-100 hours continuous lubrication.

Threaded ¼ in. or ⅜ in. gas.

Supplied with Tecalemit Hook-on or Zerk push-on nipples.

Secures continuous and positive lubrication and can be refilled without trouble or waste with the Tecalemit high pressure gun. The waste in time and material with the old type is eliminated. The job is clean, quick and simple with Tecalemit; clean lubricant where you want it—inside the lubricator.

From Barrel to Bearing without exposure—ask us how it is done.

THE LIGHT AEROPLANE
AND THE FLYING CLUBS.

A REVOLUTION IN GUARANTEES.

On and after Dec. 1, 1929, every aircraft with a Gipsy engine, which is delivered new and unused to its owner, will, subject to certain reasonable conditions, be repaired free of charge at the cost of the De Havilland Company if damaged in a forced landing caused by the failure of its engine.

This is one of the most interesting policies yet instituted in the Aircraft Industry. We are accustomed to the De Havilland Co. setting a lead to the World, but even that enterprising firm has never done anything so revolutionary.

If such a guarantee, backed by the De Havilland Co., whose good name is unsurpassed in any branch of commerce, does not instil confidence in the minds of actual and prospective owners of light aircraft, as well as in the minds of the public generally, there must be something wrong with the psychology of this country.

Needless to say, there is no catch in the offer. What it means is that the De Havilland Co. have so much faith in their own engines that they undertake to shoulder the very slight risk of having to pay up.

Briefly the stipulations are as follows: Firstly, and naturally, the indemnity is not retrospective and does not apply to machines delivered before the specified date. Also it applies only to approved types of light aircraft which hold British Certificates of Registration and Airworthiness. And it applies only when such aircraft are being used in Europe for private flying, training, taxi work, or ordinary commercial purposes. Such things as racing, record-breaking and experimental flying cancel the protection.

Yet another condition, which is fairly obvious, is that the engine shall have been properly maintained in accordance with the instructions laid down in the De Havilland Handbook.

Another necessary precaution is that the indemnity only applies when the original owner of the machine is flying it, unless the approval of the De Havilland Co. has been got to its transfer to a new owner or an approved pilot.

Lastly, and equally naturally, the De Havilland Co. will not hold itself responsible for the failure of those components of the Gipsy engine whose manufacture is not under their control. Under this heading come such things as magnetos, petrol and oil pipes, carburettors, sparking plugs, etc.

What the guarantee does in fact mean is that the De Havilland Co. guarantee their engine against breakage of any part made by them. The parts made by other manufacturers, which are specifically mentioned as nullifying the indemnity, are such that even if they go wrong they cannot possibly cause the engine to break up. At worst they can only cause a forced landing. And then if the pilot breaks his machine it is more or less his own fault.

But, under this policy, he is guaranteed against serious internal damage, which costs much money to repair, being caused by internal breakages. Such breakages are about the only thing which are likely to force a pilot to land without even flying on a mile or so to look for a decent landing ground, so the protection is greater than it looks.

About the only stipulation the firm make is, very naturally, that repairs must be done on the firm's own instruction, and that disputes of any kind shall be settled in accordance with the terms of the Arbitration Act of 1889.

The De Havilland Co. deserve to be congratulated on their enterprise, and all owners will certainly be grateful.

THE FLYING CLUBS.

In the House of Commons, on Nov. 15, in reply to a question by Sir R. Gower, the Under-Secretary of State for Air gave the names and flying membership of the following subsidised light aeroplane clubs:—

London, 285; Midland, 150; Lancashire, 180; Yorkshire, 159; Newcastle-upon-Tyne, 181; Hampshire, 275; Bristol and Wessex, 119; Norfolk and Norwich, 102; Nottingham, 61; Scottish, 228; Suffolk and Eastern Counties, 94; Cinque Ports, 94; Liverpool and District, 119.

With the exception of the Northamptonshire Aero Club, which he understood had 72 members, no information was available in regard to the membership of unsubsidised and Service Clubs, but the names of the Clubs were as follows:—Southern; Leicestershire; Berks, Bucks and Oxon; The Household Brigade Flying Club; Derby and District; Southport; The Flying Club of Ulster. (Service Clubs.—Halton; Royal Aircraft Establishment (Farnborough); Marine Aircraft Experimental Establishment (Felixstowe).)

In addition National Flying Services Ltd. had established Clubs at Hanworth, Reading, and Hull, which, up to date, had a flying membership of 464, 69, and 39 respectively.

[The figures would have been more informative if the number of members actually taught to fly and under instruction had been given.—C. G. G.]

SPREADING THE GOSPEL.

On Nov. 19 a meeting was held at 38, Bryanston Square, by the Women's Committee of the Air League of the British Empire, thanks to the generous hospitality of the Hon. Lady Bailey.

The meeting was called to discuss plans for future activities and for the enrolment of a corps of voluntary workers who would be willing to give time and talent to the League.

Lady Bailey took the chair. After welcoming her guests she introduced Lt.-Col. N. G. Thwaites, C.B.E., M.V.O., M.C., Acting Secretary-General of the Air League, who gave a brief and voluable talk on the Air League and its work,—with convincing arguments for the absolute need for stirring up the British Public and for facing Politicians with hard facts—Certainly the statistics, which with other literature were distributed to the meeting, were disturbing enough.

Dr. Gerald Merton, M.C., M.A., F.R.Ae.S. (late R.A.F.), Chairman of the Committee of the Air League, also spoke, persuading to further enthusiasm. He told us of some of the work waiting for volunteers and drew attention to the questionnaire which volunteers were asked to fill in. In this way workers can be organised to some extent. This is of great importance if good work is to be done with the enthusiastic voluntary support now offered to the League.

A general discussion was then opened which brought to light some valuable suggestions and showed the keen interest taken by the newly initiated.

Hearty thanks were given to Lady Bailey on behalf of the members of the Air League, the ladies of the Aviation Section of the Forum Club, and their friends for a pleasant and profitable party.—M. S. G.

THE HENDY HOBO.—A new low-wing monoplane (A.B.C. Scorpion) built by Messrs. Henderson and Miles at Shoreham.—(*"Aeroplane" photograph.*)

Digitized by Google

THE HENDY "HOBO."

In this year of grace—1929—which is so active in matters aeronautical, in meetings, shows, races, displays, and whatnot, there has been lastly (but by no means least) a very good display of machines produced by private enterprise, either by small new-fledged firms or private individuals. Which is very much to the good, inasmuch as it is direct proof that civil aviation is not dead, dying, or even dormant, but in a good state of healthy activity, healthier still for being private endeavour. And the machine described in the following is an example of such effort.

This aeroplane, bearing the breezy title of the "Hobo," is a very interesting machine in many respects, although superficially it is typical of a class of light aircraft of which the year is producing so large a crop. Its designers, financiers, and largely constructors are Messrs. B. B. Henderson and A. A. Miles, who by strange coincidence bear no connection to Lt.-Col. Henderson nor Mr. F. G. Miles of the Southern Aircraft Co. Ltd. Collectively they are known as the Hendy Aircraft Co. of Shoreham Aerodrome, Sussex.

Fundamentally, the "Hobo" is a single-seat light aeroplane of the low-wing full-tapered cantilever variety, with an A.B.C. Scorpion engine. It is now flying, and, not only does it look well in the air, but it has proved itself to be a very good little flying-machine.

Wings.—The wings are full cantilever and built in three sections, comprising the two outer parts, which taper in thickness and width of chord from root to tip, and the centre section, which is built integral with the fuselage. The wing section is of the bi-convex variety modified from the R.A.F. 34 to meet with existing requirements, and has a practically stationary centre of pressure.

The wing structure is a feature of outstanding interest and is the most striking feature of the whole machine, as it embodies an entirely new form of construction. There are two built-up "I" section spars with spruce flanges glued and bradded to the 3-ply webs, and as they are situated rather forward in the wing and close together they are identical in dimensions.

The spar assembly is then formed into a box-girder by the attachment to the upper and lower sides of a system of diagonal cross-braces formed by amply dimensioned spruce strut members, attached to equally generous 3-ply capping plates on the spars.

The system will be understood from the adjoining sketches. It eliminates all metal fittings and any redundancy, as the diagonals take their shares of the torsional, bending and drag loadings at the and the same time, so that no individual member is ever quite in a fact which reflects favourably in design as it is possible to proportion all members so that they deal with their own jobs only, or are partly relieved by others in taking loads, a feature in weight reduction, indeed. The system is ideal both for timber or metal construction, in either case, it taboos composite methods.

The ribs are straight-forward members, with ply webs and spruce flanges and stiffeners, with some lightening holes in suitable places. The middle portion of each rib at the junctions of the diagonals is provided with extra stiffeners and members to take the drag compressions. The loading tests made by the Farnborough people reflected very favourably upon the reliability of the construction and showed it to have a factor of safety far beyond anything that may conceivably be required in any flying. A rib-loading test, the designers asserted, showed a strength figure of over 300%.

The system is fully patented all over the World, and in point of interest it may be noted that Sq. Ldr. "Bert" Hinkler is having a machine constructed employing this wing construction method for his own use.

The wings are arranged to fold round the rear spar joints to the centre-section. To facilitate this the trailing edges of the centre section hinge forward to provide space for the trailing edges of the outer wing sections when they are folded. At present the wings are and are attached to the tail-plane, but the hinges are being modified to have universal motion so that the wings can fold with the upper surfaces towards the fuselage or to enable them to be quickly detached when necessary.

Fuselage.—The fuselage is of the ordinary ply-covered box construction which is so popular nowadays. It has four spruce rails and strut members, and carries a tubular engine mounting and fireproof bulkhead at the forward end. The petrol tank forms the fairing in front of

THE HENDY HOBO.—Various wing details. In the right bottom corner is shown a section of the wing, the details at A and B being enlarged on the left. In the top right corner are shown the details of the wing-tip.

the cockpit. A luggage locker, capable of accommodating a large suit case, is situated behind the cockpit in the fairing. The cockpit is very roomy and should prove very comfortable and free from draught. A standard "Smith" dashboard is being fitted.

LANDING GEAR.—The undercarriage is of the divided-axle type. Each unit consists of a Vee under the extremity of the centre-section with a bent axle hinged to the bottom fuselage longeron. Large size Palmer wheels (600 by 75 m/m.) are fitted. As the wheels are beneath the extremities of the centre-section, very great stability should be obtained for landing and taxying.

In this connection it may be mentioned that joints of all moving parts, both in the undercarriage and elsewhere, are lubricated by means of Tecalemit greasers, which is an engineering feature unusual in a low-powered aeroplane as yet.

The tail-skid consists of two laminations of steel and is supported beneath the stern-post by means of a steel packing block, so that in the unlikely event of a skid breaking no damage can occur to the stem of the fuselage or to the rudder. Replacement and removal depend upon the operation of two bolts only.

CONTROLS.—The flying controls are of the usual type and operation. The control column is mounted in the box formed by the spars as they pass through the floor of the cockpit. The rocking shaft is mounted on the webs of the spars by fittings at its end. A greaser at the front keeps it filled with grease to serve the moving portions.

The aileron cranks are at the rear and are so placed that the aileron cables run along behind the rear spars in a straight line to the differential cranks. The elevators are operated by cables—again in a straight line—in the fuselage by the final crank method. As the pitot head is mounted on the centre-section, no disconnections have to be made for folding the wings.—S. O. B.

DIMENSIONS.—Span 32 ft. (9.75 m.), Span (folded) 14 ft. (4.27 m.), Chord (maximum) 5 ft. (1.52 m.), Chord (minimum) 2 ft. 11 in. (.89 m.), Length 19 ft. 6 in. (5.94 m.), Height 7 ft. 1 in. (2.20 m.).

WEIGHTS.—Weight empty 435 lbs. (197 kgs.), Weight loaded (aerobatic C. of A.) 650 lbs. (295 kgs.).

PERFORMANCE.—Speed, maximum, 100 m.p.h. (161 km.hr.), Speed stalling 38 m.p.h. (61 km.hr.), Endurance 6 hrs.

HENLYS' LATEST.

Since the appearance in this paper of a paragraph recording the fact that the great motor-selling firm of Henlys (1928) Ltd. have bought a site for an aerodrome at Addington and are going in for the aircraft business on a big scale, information has been received that the firm have been appointed sole distributors in England for the Avro Avian.

The Avro Co. are to be congratulated on the deal. Many years ago one bought a car from Henlys Ltd. and one can safely say that no firm could treat its customers more civilly or in a more businesslike way than did Henlys of that period. And the way in which the firm has grown in the succeeding ten or eleven years shows that their business methods have maintained the same high level.

THE HENDY HOBO.—General arrangement drawings of the Henderson and Miles monoplane.

Besides this sole agency for Avians, Henlys have secured a district agency for Moths. In this way they ought to be able to supply anybody's needs

THE MOTH IN FRANCE.

The well-known French aircraft-constructing firm of Morane-Saulnier, of Puteaux (Seine), has made arrangements to build the D.H. Moth and the D.H. Gipsy engine under licence from the De Havilland Aircraft Co. Ltd. The machines and engines will be built in works of the Compagnie Français d'Aviation at Billancourt.

THE HENDY HOBO.—More wing details. On the left is a wing-hinge. The dotted lines show where the spar web is cut away for the insertion of one of the hinge plates. Above on the right is an ordinary former rib and the centre portion of a compression rib, and below is the trailing edge section of the wing root which folds forward to allow for the folding of the wing.

COMMERCIAL AERONAUTICS.

MUNICIPALITIES AND POWERS AT HESTON.

)uring the week the Public Works and Roads Congress s been sitting at the Agricultural Hall, Islington, and as a ult Borough and City Engineers from all over England ve been in London. On Friday, Nov. 22, a number of these ıtlemen representing some of the most air-minded dis- cts of the country, went down to Heston to have a look Heston and to witness a demonstration of the School reless set installed by Alfred Graham and Co. Ltd.

There was Mr. Elford of Wandsworth, Mr. Rivers of Har- gate, Mr. Ackfield of Leeds, with Major J. Milner, M.C., D., LL.D., M.P. for the same district (till recently Major lner has been Chairman of the Leeds Corporation Im- ovements Committee, and has been pushing Civil Aviation rd in the North), there was Mr. Heath of Swansea with . Davis, who is Mayor of that City, Mr. Dyer of Southend Sea, Mr. Donald from Belfast, Mr. Kelly of Liverpool and . McKenzie of Bristol.

One was fortunate enough to be met by Mr. Sinclair of ahams and drove up to Heston with the City Engineer of eds, Mr. Ackfield and Major Milner, M.P., whose first re- ırks about Heston were, "Neat and not too expensive," ım which one may suppose that in Heston people see the ıd of layout suited to municipal aviation.

The visitors were taken to the Social Focus and shown e wireless installation. They were then taken up to the ɔmost pinnacle of the Control Tower and shown the king- ıms of the earth, or rather Heston.

Mr. Sinclair then proceeded to give Mr. Winsor who was loting a Moth various orders, first asking him to wave the transmission was satisfactory and then telling him start up. One may say that in spite of this being a monstration the engine *did* start at the very first pull. After being told to make a number of evolutions and be- g brought along in front of the control tower the Moth as ordered to land and shut off.

When everybody had come downstairs and vaguely col- cted in the hall round the weather-chart board which the .A. have erected at Heston, Mr. Norman, and Mr. Ivor cClure, who is responsible for the Aviation Department of ıe A.A., delivered a little lecture and replied to questions hich must have done much to make things clearer to the ıunicipal visitors.

The point of the discourse was that there is no essential ıagic in forming a municipal aerodrome and that there is o need to be scared by technicalities. If municipalities ac- uire approved sites and content themselves with the civil ıgineering side, that is making the aerodrome and putting p the minimum accommodation, the repair and service side ın almost be left to the enterprise of a local garage.

A great point was made of the fact that even if the be- inning is slow it is much better to have all parts of the oncern run by local people who will have local interest and eling behind them than to have big outside interests do- ıg the development work. Outside interests will be very opular as long as things are only developing and outside ıoney is being spent but so soon as profits are made, local eling grows hostile towards the foreigner.

The visitors then sorted themselves into groups and were aken round Heston.

Mr. Dyer, who is the Borough Engineer of Southend, ook the opportunity of a flight with Mr. Winsor so that he night try out the wireless equipment. Some of the muni- ipal visitors went up to the control tower and broadcast nstructions to Mr. Winsor and his passenger. On his return he latter was very enthused about his venture.

After tea Mr. Donald of Belfast made a speech of thanks o Airwork and to Grahams, thanking them for the very nteresting visit. One thinks it was Mr. Dyer of Southend vho seconded the speech and pointed out that the time ıad now come for seaside resorts to prepare for their air- orne visitors. Mr. Norman replied and congratulated his guests on being in the forefront of municipal aviation.

Later on Lady Bailey went up and tested the wireless ap- paratus with Mr. Winsor. And thereafter one was allowed to do likewise. The School set worked quite satisfactorily and was in no way interfered with by the engine or ignition. It works in conjunction with the usual telephone set, so at one moment one was getting instructions from the Con- trol Tower and the next discussing the reception with Mr. Winsor.—T. J.

A WIRELESS OCCASION AT HESTON.

On Nov. 25 the Director of Civil Aviation, Sir Sefton Brancker, formally opened the new wireless installation at Heston Air Park.

The D.C.A. ordered the two Airwork Moths by wireless to start their engines, and then to take off one after the other. He sent instructions to them in the air as on Friday.

A FLIGHT IN THE DESOUTTER.

In spite of a very strong prejudice in favour of flying in an open cockpit, I accepted an invitation from National Flying Services Ltd. to a demonstration flight in one of the new Desoutter-Hermes cabin monoplanes which have been standardised for taxi service by National Flying Services.

This machine, which is a version of the Koolhoven F.K.41, technically modified by Mr. G. H. Handasyde, to the general ideas of Mr. Marcel Desoutter, will undoubtedly go a long way towards dissolving prejudice against enclosed cabins in aeroplanes. There is a feeling of space about the cabin and a fine view practically all round. The sliding celluloid panel in the roof gives extra light and takes away that shut-in feeling which one gets in some closed machines.

The seat for the two passengers is comfortable and at a good angle but in its present form might prove rather hard for a very long journey. There is room for two suit-cases under this seat.

Obviously various alterations in the fittings can be made to suit the individual private owner, but for the air-taxi and other work for which these machines will be used by National Flying Services, I would suggest that some form of strap, handle, or arm rest should be fitted at the sides of the passengers' seat. Anybody unused to flying likes to hold onto something on a steep bank. And, in any case, if a pilot over-banks one passenger does not always want the other slipping down on him or her.

The pilot's seat being in the middle in front of the passengers' seat gives the passengers a clear view forward and makes it possible for them to talk to the pilot. The cabin is quiet enough for the pilot and passengers to talk to each other without difficulty.

The demonstration flight was made in the afternoon of Nov. 23, a day on which the airship R.101 was unable to leave the mast because of the high wind blowing, and one of the air liners leaving Croydon had to turn back when half-way across the Channel. Although the wind was not at gale force over the London Air Park at Hanworth, the conditions were far from ideal and most of the flying for the day had been cancelled. But the flight was a most enjoyable one. The Desoutter-Hermes machine behaved beautifully under conditions which would have made flying in some light aeroplanes distinctly uncomfortable. She climbed fast and easily and cruised between 96 and 98 m.p.h. at 1,500 ft. At this height the pilot (Flt. Lt. A. J. G. Styran, M.C., A.F.C., R.A.F.O., N.F.S.) demonstrated her stability uncontrolled by flying for a few minutes with his hands and feet off the controls

After about half-an-hour's flying, during which we enjoyed a new view of Hampton Court Palace and the surrounding country, including Staines reservoirs—which I last saw from the rear-gunner's cockpit of a Service Hyderabad at about one o'clock in the morning—we made a perfect landing on the Hanworth aerodrome.

Although the surface of the aerodrome is rapidly getting into first-class condition for landing all types of aeroplanes, the Desoutter-Hermes with its 10 foot undercarriage track could land comfortably on uneven ground and looks particularly useful for moor or scrub surfaces.

Latest performance figures for this machine with the 105-115 h.p. Hermes engine give the top speed as 110-114 m.p.h., cruising speed 96-98 m.p.h., landing speed 45-50 m.p.h. The ceiling is 15,000 ft. to 18,000 ft. and the climb to 3,000 ft. in 4 minutes and to 5,000 ft. in 7 minutes. The fuel capacity is 25 gallons and the normal range 400 miles or four hours. The normal fuel consumption at cruising speed is 6 gallons per hour. She has a British certificate for airworthiness for normal flying for a weight of 1,800 lbs.—C. M. MCA.

THE G.A.P.A.N.

Following on the Inaugural Dinner of The Guild of Air Pilots and Air Navigators of the British Empire, reported in a recent issue, the Clerk to the Guild announces that he is in a position to receive applications for membership. Inquiries should be made of L. A. Wingfield, Esq., The Guild of Air Pilots and Air Navigators of the British Empire, 61, Cheapside, London, E.C.2.

Membership of the Guild is open to certificated Air Pilots and Air Navigators who are British Subjects, whether resident at home or abroad, and who are master pilots or have been for not less than five years the holders of a "B" Pilot's licence, or First Class Airship Pilot's licence, or a Certificate of Competency as a First Class Navigator of Commercial Aircraft.

During the first year of the Guild's existence, however, the five years' qualification will be waived and the Court have discretion as to whom they elect.

Early application is therefore desirable.

CROYDON NOTES

Aerodrome pyrotechnics have been causing a lot of quiet fun recently one way and another. Owing to damp or the ravages of the death watch beetle, some of our "turnips" warranted to explode at a thousand feet and consume themselves utterly before reaching the ground, have been functioning somewhat erratically of late.

One day an Argosy was reported coming in when the weather warranted a firework display. The gun was duly loaded and the fuse lit. Nothing happened for two solid minutes during which the Gent in charge of the sulky firework urged a subordinate to go and look down the tube and see what it was up to in its lair. The subordinate, though not unduly handsome, had an inexplicable affection for his face, although it was pointed out to him that a direct hit by the turnip might even improve his features.

Anyhow, they were still arguing when the Argosy loomed overhead, flying at about 200 feet. At that identical moment the lurking turnip awoke and hurled itself from the tube. Instead of mounting grandly to a thousand feet, it took and burst just in front of the Argosy's nose to the confusion of all concerned.

Another time, during thick fog, a Control Tower Officer suddenly thought he heard an aeroplane circling round the Tower. He rushed forth and fired a green Verey light and then found that the acoustical properties of the Control Tower, or of the fog, or both, had deceived him and it was an engine being run up on the ground that he had heard.

The green light eventually came to earth again on the tarmac, where an ancient labourer of the "old Bill" type dressed largely in sacks, was slowly plodding towards a job of work, spade on shoulder. The green light, flaring viciously, narrowly missed the old man's nose and fell plop at his feet. He paid absolutely no attention to it, his expression did not change and his measured plodding did not falter. It is not known whether the elderly person believes the war is still on, and that the Verey light was an everyday occurrence, or whether he is a victim of that *morgue Brittanique* which did so much to involve this country in the endless troubles consequent upon winning Wars.

Mr. Rogers, ably seconded by Mr. Bill Lawford as passenger, had one of the World's worst bumps when he took a W.10 to Athens and back recently.

A slow downward bump of about three thousand feet made them think some bell-hop in Hades had rung for the lift and then without warning, they seemed to be as urgently required in Heaven, for they suddenly went up vertically about a thousand feet.

A photograph is now in existence of Messrs. Rogers and Lawford reclining negligently against the Acropolis. So much is their presence thought to improve that venerable pile, that a movement is on foot to have life size images of them placed there permanently.

These two gentlemen have evolved a very sound theory as to how and why the Great War started, having of course visited the place where that unpleasant bicker originated.

It appears that they were sipping a modest mug of the local ale in those parts, when they observed certain ferocious-looking brigands consuming a colourless liquid, apparently so strong that it had to be tempered by large spoonfulls of plain cold rice. By means of some arm waving, they managed to obtain specimens of both the liquor and the rice.

Cautiously, and with a spoonful of the clammy antidote held ready, they sipped the deadly liquor—and it was pure water unadorned.

The theory, by the way, is that a folk who habitually drink water for choice in a public place, and who deliberately eat cold rice with it, are capable of starting a war or any other low class entertainment at any moment.

About this Eastern flying by the way, both English and Dutch pilots are inclined to think that it is a very difficult proposition to run regular services out from Europe to India and beyond. They say that it is all very well to do a stunt flight out there and back once, and then give lectures about it with lantern slides of oneself in a tropical kit and shorts disclosing hairy knees, but that it is a very different thing to attempt to fly a regular scheduled mail service, and that possibly the time is not yet ripe for such.—SPRY.

FOR OUR BETTERMENT.

On Nov. 20 Mr. W. B. Mitford, the instigator, organiser and promoter of the British Indestructo Glass Co. Ltd., of Chase Estate, Park Royal Road, London, N.W.10, gave a dinner at the Grosvenor House Hotel to a number of friends in the City and in commerce, to meet Mr. Louis Bartlestone the founder, and still the chief proprietor, of the American Indestructo Glass Co.

Introducing Mr. Bartlestone, Mr. Mitford, who is more than a little of a rhetorician, explained more or less how he proposes to capture the British Trade in safety glass. Somewhat recklessly, in view of the fact that representatives of certain very big manufacturers and users of motor vehicles were present,—not to mention the Press—he told us what a handsome profit per square foot the firm would make out of their glass, and what a huge dividend that would mean for the lucky shareholders. But as, apparently, Indestructo glass works out cheaper than most other safety glasses, even after making such profits, there seems no reason why the firm should not do the business.

Mr. Louis Bartlestone, who said that he had *discovered* this particular method of making Indestructo glass but had not invented it, impressed one as being a man of outstanding ability. In voice and manner and appearance he reminded one of Lord Reading.

Mr. Bartlestone refused to make a speech, he merely asked to be asked questions. His answers to the questions which were hurled at him showed him to be a man who understands his business from the bottom to the top.

He explained why some safety glasses go to pieces because the cement used in fixing the celluloid to the glass dissolves the celluloid and makes it like a sponge. He also explained why certain solvents used on other forms of cement cause the celluloid to go dark and ruin the visibility. —Personally one regards this as being most dangerous, because it is liable to lead to complete misjudgment of speed and distance by the driver, apart from which this discolouration gives one the impression of driving under a foggy sky and definitely produces a feeling of depression which in itself makes driving dangerous.

Describing Indestructo Glass Mr. Bartlestone told us that there is no actual cement used at all. Adhesion is caused by coating the celluloid with castor oil and squeezing the glass onto it under heavy pressure. Such of the castor oil as is not squeezed out amalgamates with the celluloid and itself hardens onto the glass and so makes it stick. So

Marconi Equipment for Air Ports

Quick and reliable communication with aircraft and other aerodromes is the keystone of efficiency of air ports and aerodromes. Marconi wireless telephone and telegraph transmitters are specially designed as ground stations for air services. These transmitters are built in various sizes and powers to meet the individual requirements of any air port and to provide the maximum efficiency in communication. Their design is based on world-wide experience in fulfilling the requirements of air services.

complete is this adhesion that there is no need to seal the edges of the glass to prevent cement from leaking out or air from leaking in.

The whole process only takes a matter of 27 minutes as against many hours,—amounting in certain types to 13 or 14 hours—in the processes used in making some other forms of safety glass. One important result of this process is that Indestructo glass can be cut to any desired shape by any ordinary glass-worker.

Mr. Bartlestone assured us that the English factory, which will be temporarily in charge of one of his most trusted assistants, is every bit as well-equipped as his own factory in the States, and in other respects is a better factory because it has been built for this particular job and has not grown up to it.

Mr. Mitford, having been reminded by somebody that Mr. Bartlestone had said nothing about bullet-proof glass, brightly remarked that this commodity had been left out of the discussion because we live in such a peaceful and free country that any need for it seemed unlikely, but he assured us that the English Factory could produce bullet-proof glass if needed.

Altogether the speeches of Mr. Mitford and the sound and convincing common-sense talked by Mr. Bartlestone left us all with the impression that the firm's prospects in this country are of the most promising.—C. G. G.

A BROOKLANDS PARTY.

On Saturday night last the Brooklands School of Flying gave a very cheery party at the Thames Riviera Hotel, lately Karno's Island, and further back still Tagg's Island.

The occasion deserves particularly to be noted because there were no speeches. Capt. H. D. Davis, A.F.C., the chief of the School, proposed "The King," and Mr. Harris of the Northampton Club told us what good fellows the Brooklands School are, which we all knew before, so we were able to applaud with knowledge of the subject. And after everybody had well eaten and drunken we proceeded to dance till well after the prescribed hour of midnight.

The whole affair was thoroughly cheery and the proprietors of the School fully deserve the hearty thanks which they received from their guests. The Brooklands School has had a highly successful season and undoubtedly there is no school in this country or any other where tuition is given more thoroughly or more intelligently, so its success is fully deserved. One can only hope that its success may continue.

SITUATIONS VACANT.

Aircraft Draughtsmen required immediately. Write, stating age, experience and salary required, to Handley Page Ltd., Cricklewood, N.W.2.

First-Class Aero-Engine Draughtsmen and Checkers required. Write, stating age, experience and salary required to Frank B. Halford, 9, Golden Square, London, W.1.

Ground Engineer vacancy now filled. Applicants are thanked.—BM/BR4F, W.C.1.

One Stressing Draughtsman required. Write stating age, experience and salary required to Comper Aircraft Co. Ltd., Hooton, Wirral, Cheshire.

SITUATIONS WANTED.

Experienced "B" Licence Pilot is available in either temporary or permanent capacity for Air Taxi demonstration or similar work. Aged 28: Public School: 1,200 hours flying on all types, including twins, two-seaters, single seaters and seaplanes. Instructor at C.F.S. A.1. Category. Ground job of permanent nature with possible financial interest would be considered.—Write in first place to Box No. 5733, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Ground Engineer, A, B, C and D, seeks permanent position. Sound production and maintenance experience. Good references. Box No. 5737, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Public School Boy seeks progressive position abroad where aircraft communications are being developed, preferably in Colonies. Keen, Pilot's "A" Licence, slight business experience. Box No. 5741, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound Instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. **Write to-day** for our "Aeronautical Engineering" Booklet. **International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.**

EDUCATION.

The time has arrived when a man's education is incomplete until he has learned to fly. Modern times demand modern accomplishments and modern communications demand modern means of transport.

There is no form of education not having its various grades of educational establishments. A man is invariably proud of his old School because he is proud of the education he received there and because he is proud of its name.

You would not learn mathematics from an inexperienced mathematician. How much more important it is to learn flying from those of the greatest experience! You can break your neck by bad pilotage, but did anybody ever break his neck by bad mathematics?

The Brooklands School of Flying has made its name by the quality and reliability of the pilots produced. Its instructors have the EXPERIENCE necessary to turn out the SAFEST pilots and to give the best possible flying education.

ON VARIOUS THINGS.—II.

ON LOST OPPORTUNITIES.

On Nov. 28, Sq. Ldr. Probyn delivered to the Royal Aeronautical Society a lecture on "Flying and Maintenance from the Owner's Point of View." Considered purely as a lecture, it was among the three best lectures one has ever heard. Considered for its value to the Aircraft Industry, as a mine of information on what the market wants, it was one of the most valuable lectures ever given before the Society. And there were fifty people in the audience.

Among these fifty were Mr. Alan Butler, Chairman of the De Havilland Aircraft Co. Ltd., Capt. Geoffrey de Havilland, Managing Director, Mr. F. T. Hearle, Works Manager, and Mrs. Alan Butler, presumably in an advisory capacity from the woman pilot's point of view. There was also Sq. Ldr. Tom England, of the Handley Page Company. There was Mr. O. E. Simmonds of the British Spartan Aircraft Co. Ltd., and there was Mr. Ratcliffe of the Westland Company and Mr. M. L. Bramson of the Monospar Wing Co.

That was the extent to which the British Aircraft Industry was represented. And the question arises whether that represents a measure of the intelligence of the British Aircraft Industry when the demands of the market are being considered. Comparisons may be odious, but was it only a coincidence that the firm which does the most business, and therefore presumably knows most about the demands of the market, should be so strongly represented at a lecture given by a pilot who flies another maker's aeroplane? Some people like to learn. Others refuse to learn.

Of course, if we of THE AEROPLANE were at all conceited, we should draw the inference that all the other people in the Aircraft Industry who were not present are so intelligent that they know that any lecture of any real value is always fully reported in THE AEROPLANE and that by merely waiting for the next week's copy of THE AEROPLANE they would get all the information without putting themselves to the trouble and inconvenience of getting to John Street, Adelphi, at the unholy time of 18.30 hours, at which the Royal Aeronautical Society chooses to start its lectures.

The inconvenience of this hour has been mentioned many times in THE AEROPLANE. People in business, especially people employed in aircraft factories some miles out of London, cannot get to these lectures at that hour unless

"IT IS WORTH WHILE LIVING IN LONDON, SURELY, TO ENJOY THE COUNTRY WHEN YOU GET TO IT."—*(Thackeray.)*

UP FROM THE COUNTRY.—An Imperial Airways Tea-plane (Armstrong Whitworth Argosy—three Jaguar engines) over the City. Waterloo Bridge is in the foreground, with the Blackfriars Bridges above, and Southwark, Cannon Street and London Bridges beyond. The Tower Bridge is hidden by the tail of the machine. St. Paul's Cathedral is seen on the left just by the wing-tip of the photographer's machine.

Digitized by Google

they leave their offices early. Consequently, if there is a big audience at one of the Society's lectures, one of two things explains it. Either the heads of firms have given special leave to their drawing-office and design staffs to go early so as to be in time for the lecture, or else that the high-brow scientists at the Air Ministry and South Kensington and so forth think the occasion is important enough for them to leave their offices early to get to the lecture.

Now there seems to be a kind of idea in the Aircraft Industry that unless a lecture is concerned with a whole lot of *x, y, z,* and *Kx, Ky,* and *cosines,* and *tangents,* and things like that, it cannot be of value to any design staff. And so far as the high-brows are concerned, they hardly ever turn up at these lectures unless they see an opportunity of getting up and telling one another what fine fellows they are. In fact, the real high-brows in aviation, as in other pseudo-sciences, constitute about the finest close corporation of back-scratchers and log-rollers one has ever met. Doubtless it was this characteristic of the scientific side of the Aircraft Industry which led to that historic phrase from a thoroughly sound official of the Air Ministry when, daring to criticise something in one of their high-brow lectures, he excused himself with the remark that "a chorus of praise has a monotony which is only tolerable in Heaven."

Sq. Ldr. Probyn's lecture contained nothing to interest the slide-rule merchants and *x*-chasers. And there was nothing in it to give the scientists an opportunity of saying what fine fellows they are—despite the fact that nobody has ever yet designed a successful aeroplane by their theories. But there was enough cold common-sense in that lecture to make the fortune of any aircraft firm which had the sense to work it all out on paper and produce an aeroplane to fulfil Sq. Ldr. Probyn's demands.

One of the most amazing things about the meeting was that after Sq. Ldr. Probyn had laid down the requirements of a private owner—which requirements are equally those of any aircraft operating firm which hopes to run charter-planes (commonly called taxi-planes) at a profit, the real best brains in the Aircraft Industry who were present got up and agreed with him whole-heartedly, even to the extent of agreeing that a pusher monoplane is the ideal type of aeroplane for the conditions of the immediate future. And this, curiously enough, is what The Aeroplane has been preaching for quite a long time

On top of this, those who are really interested in aeronautical progress, and not merely in arguing about scientific theories which never get anywhere, may like to know that Sq. Ldr. Probyn's requirements were heartily endorsed by Mr. H. A. Wimperis, our essentially practical Director of Scientific Research at the Air Ministry, who was in the Chair, and by Sir Sefton Brancker, our Director of Civil Aviation, who probably knows more about air transport from the passenger's point of view than any other living man, and by Dr. Gerald Merton. the new Chairman of the Committee of the Air League, who, besides having been a war pilot, is the owner of a Moth, in which he puts in something over 100 hours' flying a year. What Dr. Merton does not know about running an aeroplane as a private owner has yet to be discovered.

There must be in the design departments of our various war-plane factories quite a number of intelligent young men who could design very much improved civil aircraft if they were allowed to do so. Also there are, among the readers of this paper, including people in the Services, some thousands of men and women who will ultimately become owners of aircraft, or at any rate will influence their rich relations in buying aircraft, just as the youngsters of twenty-five and thirty years ago influenced their people to buy expensive cars of their own.

For the benefit of these readers rather than for the benefit of the scientists and all those proprietors, directors and managers of aircraft firms who are so satisfied with their present position as to be able to ignore the possibilities of civil aircraft, the substance of Sq. Ldr. Probyn's lecture and the subsequent discussion is given a considerable amount of space further on in this paper.

Also in this paper will be found a description of a certain new type of aircraft which is being produced abroad and is not being produced in this country. It represents what the market wants. And it could be built in this country just as well as anywhere else.

In a curiously circuitous way one learned the other day that the Right Honourable James Thomas, Lord Privy Seal, more commonly known as Jim Thomas the Unemployment Minister, is to meet representatives of the British Aircraft Industry to discuss with them the possibilities of the Aircraft Industry as a means of increasing our export trade and decreasing our unemployment.

There is a possibility that the Aircraft Industry may ask Mr. Thomas for a grant out of the Unemployment Vote as a kind of parallel to the subsidies paid to the Flying Clubs and to Imperial Airways Ltd. and National Flying Services Ltd.

Anything of this kind would be most deplorable. After all, we cannot all live on the dole. Somebody must do a job of work and make some money before we can raise the money out of which to pay doles.

There may be some excuse for paying unemployed unskilled labour out of the Unemployed Vote for digging up and laying down aerodromes, because that is putting money into permanent improvements for the benefit of the Nation. But the idea of paying the taxpayer's money to industrialists to help them in businesses which with the exercise of a little intelligence and initiative could be made immense profit-making propositions is sheer imbecility.

There is more money to be made out of following the plain simple advice, and supplying the plain simple demands, set forth in Sq. Ldr. Probyn's lecture than can ever be got out of asking Mr. Thomas for doles for the support of the weaker brethren of what ought to be a great and growing industry,—and will be when some of the younger men and younger firms get going.—C. G. G.

ON SPORTSMANSHIP AND POLICY.

Quite a lot of excitement seems to have been caused in the Daily Press by the announcement from New York on November 26 that Mr. F. Handley Page, before sailing for England, had lodged a protest with the Contest Committee of the Guggenheim Safety Aircraft Competition against the admission to the Competition of the Curtiss Tanager aeroplane. Mr. Handley Page apparently based his protest on the rule which says that "The employment of design features which in the opinion of the Committee are copied from the design of another Competitor may render the aircraft ineligible for entry."

This mere quotation does not make clear whether Mr. Handley Page's objection is simply to the use of the Handley Page slots in the Curtiss Tanager without license, or to a colourable imitation of the H.P. slots, or whether he claims that the Curtiss machine is definitely copied from the Handley Page machine which is humorously known at the Handley Page Works as the Gugnunc. Judging by the descriptions of both which were published in The Aeroplane last week this last does seem to be so.

If the Tanager were definitely copied from the Gugnunc, then undoubtedly Mr. Handley Page would be within his rights, as a sportsman as well as a business man, in lodging

THE "CLASS B" AIRCRAFT.—The Westland Four (three Hermes engines) for four passengers and pilot,—included by Squadron Leader Probyn in the second category of aircraft needed by private owners.

a protest of this kind. Such, however, can hardly be possible. The Handley Page Gugnunc did not even start for America until after the Curtiss Tanager must have been well on the way towards being finished. Consequently Mr. Handley Page's protest must be based on the employment of the famous Handley Page slotted wings in the Tanager. If such be the case, then we may reasonably ask whether he has not made a mistake in policy in lodging a protest.

The question of the validity of the Handley Page patent does not arise here. It has been acknowledged by the British Government and by the United States Government. The U.S. Navy has paid the Handley Page Company a large sum for the use of the Handley Page Patent Slots in American Naval Aircraft. The British Government is also said to have paid handsomely for the use of the slots, although undoubtedly whatever sum has been paid it cannot be commensurate with the value of the lives which have already been saved through the use of the slot.

There are claimants to prior patents. For example, only the other day an American paper published an article claiming that Señor Alfredo Leigh, who is Professor of Aeronautics at the Chilean Military Academy, does in fact hold a patent which antedates that of Mr. Handley Page. There are also English patents of an obviously similar nature which are said to antedate the Handley Page Patent. That question does not concern us at the moment.

The point that really is of interest to all who are concerned with British Aeronautics is the question of whether lodging a protest against the Curtiss Competitor in the Guggenheim Competition was wise from the point of view of British aviation as a whole.

There are obviously two ways of looking at a competition of this kind, irrespective of the value of the prize to be won. One may regard it purely as a sporting competition in which, regardless of subsequent financial results, one is all out to win in a thoroughly sporting spirit. In such case one would let everything go, except the mere fact of winning the competition on the sheer merit of the apparatus which one had entered for it.

Another way of looking at such a competition is to consider, first and foremost, the business results which are likely to be achieved by winning such a competition with one of the products of one's own particular manufacture. Here one might be a stickler for the strict interpretation of the rules as such. But, even so probably there would be a certain advantage to be gained by interpreting everything else in the most sporting spirit possible.

The winning of the Guggenheim Competition, considering the international interest which it has caused, not only among people who are directly concerned with flying, but among all those millions of people who are mildly interested in flying and are particularly interested in anything which is supposed to make flying safer, is in fact worth a great deal more than any possible money prize which can be offered. And if the competition can be won with something like a gesture of generosity attached to it, the consequent advertisement all over the World must be all the greater.

Now supposing the Curtiss machine does infringe the Handley Page slot patents, and a Handley Page machine won the competition without any protest having been made against the Curtiss machine, then the Handley Page Company would have the kudos not only of winning the competition by virtue of being a better all-round aeroplane, but its owners would also have the added advertisement of having behaved generously in admitting, without protest, a competitor who on the face of it was infringing patents which enabled the Handley Page machine to win the competition. The victory would then be not only mechanical but moral.

Supposing, on the other hand, that the Curtiss machine won the competition with the Handley Page machine a good second. Then the Handley Page firm would at any rate have the consolation of being able to say that the only thing in the competition which was able to beat them was a machine fitted with their own patent apparatus. Thus in consequence they would have a moral victory if not a mechanical victory. And they would always have the course open to them of proceedings against the Curtiss Company in the American Court for infringement of their patent, with a substantial claim for damages.

But now, unfortunately, the raising of this protest is apt to give our friends and competitors in the United States the impression that the Handley Page Company are afraid of being beaten before the competition starts, and so have rushed in a protest in the hope of preventing the Curtiss machine from competing at all,—thus presumably leaving the way open for their machine to win, on the assumption that there is nothing else in the competition which looks like winning or even of putting up a decent performance, with the exception of either the Curtiss or the Handley Page.

Nobody will deny that a £20,000 prize is very well worth having and that any competitor, more especially the only competitor representing the British Aircraft Industry in such a competition, is justified in doing his level best to win such a handsome sum of money. But leaving out altogether the question of sportsmanship, and looking at the affair purely as a matter of the prestige of British Industry, there is the possibility that the better policy would have been to have fought the competition out to a finish without raising any protest and to have seen which machine of all the competitors was the best purely on its merits, and regardless of whose particular patents might be used in its design.

Obviously if a British aircraft could have won Mr. Guggenheim's handsome prize without any protest at all, and purely on its merits as a flying machine, the result would have been of immense benefit to the prestige of British Aircraft all over the World. It would have been a worthy sequel to the winning of the Schneider Trophy and the beating of the Speed Record by the Supermarine Rolls-Royce S.6. We should have shown the World that we could make the world's safest aeroplane as well as the world's fastest aeroplane.

Now if we win we shall win more or less on the strength of a protest, or at any rate we shall have left in the United States the reputation of having tried to win on a protest even if we actually win on our merits. And, if the Curtiss Tanager wins in spite of the protest, people in the United States will think that the protest was made because the Handley Page machine was known to be inferior.

In the bad old days before we came to know our American cousins as well as we do to-day, certain American prize-fighters and athletes came to Europe and won for themselves, and quite undeservedly for the United States as a whole, the reputation of being bad sportsmen. There used to be a saying that American sport was conducted on the "win, tie, or wrangle" principle.

In more recent years we have had American athletes

FAR EAST AVIATION.—An Avro Avian (Cirrus Hermes), the property of the Far East Aviation Co. Ltd., taken at Kai Tak Aerodrome, Hong Kong. On the left is Mr. R. Vaughan Fowler, Managing Director of the firm, and on the right in white is Mr. F. R. Smith, another Director. This machine has been bought to demonstrate the Avian and the Hermes to the Chinese Governments and to prove to them the excellence of the workmanship which is put into British aircraft and engines. This machine is in "Class C,"—as reckoned by Squadron Leader Probyn.

and American sportsmen of all kinds over on this side of the Atlantic. Quite a number of English sportsmen have gone to America for all sorts of competitions. And in almost all these competitions Americans have shown themselves to be sportsmen up to the highest standard.

Over and over again they have beaten us on sheer excellence of training. They have never claimed that their men have been physically better than ours, and they have seldom beaten us by sticking out for the strict letter of the rules. They have beaten us on sheer thoroughness and efficiency, just as they have beaten us in commerce all over the World by thoroughness.

Occasionally when we have turned out a really first-class man who has taken the job seriously, we have beaten them. And whenever we have beaten them they have taken their beating in the finest possible sporting spirit.

There has never been a finer exhibition of sportsmanship than that which was shown by the United States Naval Air Service when, in 1924, owing to the crashing of a British competitor, there were no foreign aircraft to compete against the U.S.A. in the Schneider Trophy contest. The Americans called the race off and declined to claim a win on the Schneider Trophy by simply flying over the course as they could have done. Instead of doing that they flew over a different course and beat the speed records from the short distance up to a matter of a few hundred kilometres. This was just by way of showing that they could have beaten our speed machine if we had sent any over.

Therefore, the pity is all the greater that in a great international contest like that promoted by the Guggenheim Fund, with the idea of discovering a safe aeroplane for the good of aviation all over the world, we should have lodged a protest against any competitor on a purely legal point of patent law instead of adopting the attitude that we also wish, at any cost to ourselves, to discover who can make the best and safest aeroplane under the rules which have been worked out with great forethought by the Contest Committee of the Guggenheim Fund.

When the time comes for the machines to go through all the tests of the competition, we all sincerely hope that the Handley Page machine will win. Such a win would be a fine advertisement for the British Aircraft Trade as a whole,—and, heaven knows, British aircraft need *some* advertising apart from the high standard of workmanship in our war-machines. Also personally, one would be glad to see it win because perhaps one can claim better than anybody else who writes on the subject of aviation to have shown through thick and thin a firm faith in the efficacy of the Handley Page slots, first of all as a means of getting off the ground and onto it slowly and safely, and secondly, when it was produced in its automatic form, as a means of saving life.

In fact, so great is one's faith in the slot form of aerofoil that one is grievously disappointed at the practically negligible results which have been achieved by slots since they were introduced to the World by The Aeroplane, some ten years or so ago. When one considers what the slots can do in the way of getting a machine off the ground in a short distance and in getting it down practically vertically, the way in which the slots are used to-day is merely childish.

Barring one or two experimental aircraft there is no aeroplane in the World to-day fitted with slots at all as they ought to be fitted. All we have done in practice is to fit our machines with a species of slightly inefficient skyhook at the tip of each wing, and to impart to the aeroplane itself in consequence a little of that type of stability which pertains to a pendulum.

Being hooked up by the wing-tips, the aeroplane tends to remain right side up. But we neglect altogether the immense amount of extra lift that could be got by fitting slots the whole way along the leading edge of each wing. And we have not even attempted to get the still further advantage which can be got by fitting slots somewhere near the front part of the trailing edges of the wings.

Whether this slow progress is due to lack of intelligence in the Technical Department of the Air Ministry, or whether it is due to conservatism on the part of other aircraft firms who do not believe in slots, or whether it is simply jealousy of one firm for another which prevents the people who did not invent the slot from agreeing to pay a royalty on slotted wings, or whether it is that Mr. Handley Page demands too much money in the form of royalty for the use of the slots, one does not attempt to judge. The unfortunate fact remains that we are only using slots as safety gadgets instead of as lifting factors for the whole aeroplane.

From what little we know of the Handley Page Gugnunc which was built for the Guggenheim Competition, it seems to be fitted with slots the whole way along both wings. The machine was kept such a deadly secret till it left for the States that the Americans were the first people to know anything about it. At any rate, it is something of a step in the right direction, even though it gets off the ground, and alights, with its tail hanging down in a way which would never be accepted commercially in any private or public transport vehicle, and would probably bring into being new sorts of dangers of its own.

Whether the Curtiss machine is similarly fitted one does not know. But, whether it is or not, nothing could be more regrettable than stopping any machine fitted with slots used in any way from competing in such a contest whatever may be the way in which the slots are used.

What the World wants to know is what are the best results that can be got with slots. If some firm other than the Patentee gets better results with the patent, then surely it is in the interests of the progress of aviation that such a machine should be allowed to show its capabilities. If it uses the slots better than the machine designed by the Patentee, then the World at any rate is the better for that knowledge. And if the original Patentees are wise they will either copy the winning firm's design, or else if it involves new patents, then they will make an amicable working arrangement on a cross-licence. What we want in aviation is progress.—C. G. G.

WORLD'S RECORDS.

The Royal Aero Club has been informed by the Fédération Aéronautique Internationale that the following World's Records have been granted:—

Greatest Speed over 100 Kilometres.

Flg. Off. H. R. D. Waghorn, A.F.C., on Supermarine-Rolls-Royce S.6 (Rolls-Royce "R") on Sept. 7, 1929:—330.1 *miles per hour* (531.200 *kilometres per hour*).

Flg. Off. R. L. R. Atcherley, on Supermarine-Rolls-Royce S.6 (Rolls-Royce "R"), on Sept. 7, 1929:—331.6 *miles per hour* (533.800 *kilometres per hour*).

World's Greatest Speed.

Flt. Lt. G. H. Stainforth, on Gloster-Napier VI (Napier Lion VII D), on Sept. 10, 1929:—336.3 *miles per hour* (541.100 *kilometres per hour*).

Sq. Ldr. A. H. Orlebar, A.F.C., on Supermarine-Rolls-Royce S.6 (Rolls-Royce "R"), on Sept. 12, 1929:—357.7 *miles per hour* (575.700 *kilometres per hour*).

SPEED IN FRANCE.

On Nov. 15 M. Paillard made a speed of 280 m.p.h. over the Lac d'Hourtin, near Bordeaux, in a Bernard seaplane (Hispano-Suiza engine). It was incorrectly reported in The Aeroplane recently that the machine he used was a Nieuport-Delage seaplane.

The particular machine he used is not one that has been specially developed for the Schneider Trophy Contest, but is a development of the Bernard 20-C1 single-seat fighter monoplane converted into a seaplane and fitted with special wings for high-speed training purposes.

It has a Hispano-Suiza Vee type engine which gives 1,000 h.p. at 2,400 r.p.m. During this test the engine was run at 1,700 r.p.m., which gave 700 h.p. only.

Further tests will be made with this machine in accordance with the requirements of the French Air Ministry, after which a land undercarriage will be substituted for the floats, and wings of 9 sq. m. area will be substituted for those of 12 sq. m. now fitted, after which M. Paillard will make an attempt to beat the World's Speed Record for landplanes, which is at present credited to the late Lieut. Bonnet.

The Bernard company is, in the meantime, completing a new racing seaplane to take the new 1,500 h.p. Hispano-Suiza "inverted T" type engine.

HAWKER HORSLEYS IN GREECE.

Last April, as reported in The Aeroplane of April 17, 1929, six Hawker Horsleys, with Rolls-Royce Condors, were ordered by the Greek Naval Air Service. These were delivered at Tatoi Aerodrome on Dec. 2. The British Minister, the staff of the Greek Ministry of Marine and members of the Greek Government, saw the trial flights and afterwards witnessed demonstration flights made by the Greek Naval Air Service.

A DATE TO BE NOTED.

Anybody who is likely to be in Town on Saturday, Dec. 14, ought to make a point of going to the Wigmore Hall, in Wigmore Street, to hear Sir Philip Sassoon lecture, with lantern slides, on his journey to India and back by flying-boat and aeroplane. The lecture begins at 3 p.m.

The substance of the lecture is naturally that of his excellent book, *The Third Route*. But there are always things which a lecturer can say and cannot put into print, and, anyhow, even those who have read the book will find that going to the lecture is well worth while, for Sir Philip has a charming way of speaking which will make the reading of the book a second time all the more interesting.

Apart from that, the lecture is being given in aid of that excellent institution, the Royal Northern Hospital, so the money will be well spent. Tickets are 8s. 6d. and 5s. 9d. for reserved seats, and 2s. 4d. for unreserved seats, and may be obtained from The Secretary, 25 Park Lane, W.1.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, November 26.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—The following Plt. Offs. on probation are ıfirmed in rank:—R. J. T. Barrett (Nov. 1); J. D. H. Slade (Nov. 1); E. W. M. Cavendish Pelly (Nov. 2); J. O. H. Lobley (Nov. 5); H. E. Tew (Nov. 25). The following Plt. Offs. are promoted to e rank of Flg. Off.:—A. Le R. S. Upton (Oct. 8); G. F. Macpherson ct. 13).

The following cease to be seconded for duty with the Royal ıstralian Air Force:—Group Capt. M. Spicer (Nov. 12); Sq. Ldr. M. Drummond, D.S.O., O.B.E., M.C. (Nov. 15).

The following are placed on the retired list:—Flt. Lt. L. Wanless-Gowan (Nov. 6); Flg. Off. T. Marchant (Nov. 25); Flg. Off. B. S. rice, A.F.C. (Nov. 25). Flt. Lt. L. S. Potter is transferred to the eserve, Class C. (Nov. 25).

MEDICAL BRANCH.—J. W. H. Steil, M.B., is granted a temp. comn. as Flt. Lt. (Hon. Sq. Ldr.) with effect from and with seniority of ct. 30; Flg. Off. J. C. Neely, B.A., is promoted to the rank of Flt. t. (Nov. 11); Flt. Lt. R. A. W. Kerr, M.B., is transferred to the eserve, Class Dii (Nov. 22).

CHAPLAINS BRANCH.—The Rev. J. Lavin is granted a S.S. comn. as a haplain (Roman Catholic) with the relative rank of Sq. Ldr. (Nov. 1).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—F. W. Hartridge is granted a comn. in ne Special Reserve as a Flg. Off. on probation (June 29) (substituted or the notification in the *Gazette* of Aug. 27). The following are ransferred from Class A to Class C:—Flt. Lt. R. W. F. Dunning (Oct. 1); Flg. Off. B. J. Finn (Sept. 29); Flg. Off. I. J. Sankey (Sept. 22). 'lg. Off. R. K. Coupland is transferred from Class C to Class A Nov. 6). The following Flg. Offs. relinquish their comns. on completion of service:—J. J. Comerford, C. McL. Reid (Nov. 1); H. W. Beck (Nov. 8). Flg. Off. O. M. Sheil-Small resigns his comn. (Nov. 4).

STORES BRANCH.—Flt. Lt. R. V. Robinson, O.B.E., is transferred from Class B to Class C (July 27).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 602 CITY OF GLASGOW (BOMBER) SQUADRON.—Plt. Off. A. H. C. Gibson resigns his comn. (Sept. 25).

Squadron Movements.

No. 101 (Bomber) Squadron moved from Bircham Newton to Andover on Oct. 12, 1929.

No. 207 (Bomber) Squadron moved from Eastchurch to Bircham Newton on Nov. 9, 1929.

Officers' Pay.

In the House of Commons on Nov. 27 Capt. Balfour asked the Secretary of State for Air if, in view of the fact that certain ranks of R.A.F. Officers engaged on active flying duties were paid less than their corresponding ranks of Army officers, and in view of the risks of flying and increased standards of technical knowledge and skill required for the R.A.F., the Air Ministry would consider recommending a revision of the basic rates of pay in respect of these ranks.

Mr. Montague said that in considering this question it was necessary to have regard to the whole career which the Service offered, including pay in all ranks and the opportunities for promotion. While the prospects and emoluments of Air Force Officers were constantly under review a revision of existing basic rates of pay was not called for at the present time.

Capt. Balfour asked Mr. Montague if he was aware that a Squadron Leader after five years in the R.A.F. got £1 16s. a day and that a Major in the Army, after five years drew £1 17s. Did he think that flying risk was equal to a shilling minus.

Special Assessments.

The following officers and airmen have been awarded special assessments, as shown, on completion of a course of *ab initio* flying training at No. 4 Flying Training School.

Distinguished Pass:—Plt. Off. F. S. Barron, Plt. Off. G. F. P. O'Farrell.

No. 363829 Sjt. Cook, F. W.; No. 362338 Sjt. Gordon, J. R.; No. 362571 Sjt. Kidd, E. C.; No. 363671 Sjt. Newton, J. A.

Notations have been made in the official records of the officers and airmen.

Manston Station.

In the House of Commons on Nov. 27, in reply to Capt. Balfour, the Under-Secretary of State for Air said that it was proposed to retain the R.A.F. Station at Manston as a permanent peace-time station. It was not proposed to construct any additional married quarters for officers and other ranks in the near future. It was true that at the present moment there were not quite enough quarters available, but, as soon as the bombing Squadron which was there at the moment had left, the position would be normal.

The R.A.F. Staff College Emblem.

Replicas of the Silver Hawk are being made under the supervision of Mr. Frank Bowcher, the sculptor of the emblem. The replicas, which are five inches in height, can be supplied in two styles at the following prices: In silver, £2 12s. 6d.; in bronze, £2 7s. 6d. These prices include packing and postage to any address in the United Kingdom. To purchasers from abroad, the difference only in cost of packing and postage will be chargeable.

All graduates of the R.A.F. Staff College are entitled to purchase replicas. Orders will only be accepted by Mr. Bowcher on instruction from the Adjutant, R.A.F. Staff College, Andover, to whom intending purchasers should send their requirements, giving full address. These orders will be forwarded to Mr. Bowcher, who will supply the replicas and to whom payment should be made direct.

THE LATEST SINGAPORE.—The Short Singapore long range reconnaissance flying-boat (two 825 h.p. Rolls-Royce "H" engines). It is a modification of the original Singapore in which Sir Alan Cobham flew round Africa. The new machine has modified hull lines, the latest Rolls-Royce engines and Handley Page automatic slots.

Digitized by Google

The Chanucah Service.

A special Naval, Military, and Air Force Chanucah parade and service will be held on Dec. 29, at the Great Synagogue, Duke Street, Aldgate, E.C.3, and, so far as Air Force exigencies permit, opportunities will be afforded for officers and airmen of the Jewish faith at home stations to attend the service.

Officers and airmen who wish to attend should communicate as soon as possible with the Rabbi, M. Gollop, B.A., Senior Jewish Chaplain to H.M. Forces, 7, Westbourne Terrace Road, London, W.2.

Miss Douglas Pennant.

In the House of Commons on Nov. 27 Mr. W. J. Brown asked the Prime Minister whether he would agree to the setting up of an independent tribunal to investigate the charges against Miss Douglas Pennant which led to her dismissal from the Royal Air Force. The Prime Minister said that the answer was in the nagative. He had given this case further attention and had submitted the papers to the Government's legal advisers. After full and sympathetic consideration the difficulties of having the matter reopened after so long a lapse of time had been seen to be insuperable. In view of what was said to be the reason why this case should be re-opened, he ought to add that there was no question of Miss Douglas Pennant's super-session having been due to any sort of neglect of duty on her part or to any cause which would in any way justify aspersions on her character.

Boxing.

A team of Danish Amateurs beat the R.A.F. at Cranwell on Nov. 29 by seven events to one. The results in detail were:—

Fly-weight.—Aage Petersen (Denmark) beat AC. Dossett (Gosport, R.A.F.) on points.

Bantam-weight.—Henry Museth (Denmark) knocked out AC. Johnson (Manston, R.A.F.) in the fifth round.

Feather-weight.—Anker Poulsen (Denmark) beat AC. Borland (Digby, R.A.F.) on points.

Light-weight.—Carl F. Jensen (Denmark) knocked out AC. Garrett (North Weald, R.A.F.) in the fourth round.

Welter-weight.—Arne Sande (Denmark) beat L-AC. Buchanan (Digby, R.A.F.) on points.

Middle-weight.—Reinhold Sylvander (Denmark) beat AC. Clapp (Old Sarum, R.A.F.) on points.

Light-heavy-weight.—AC. Munkley (Henlow, R.A.F.) beat Eberhand Hansen (Denmark) on points.

Heavy-weight.—Poul Moen (Denmark) knocked out Plt. Off. G. E. S. Williams (Digby, R.A.F.) in the sixth round.

The R.A.F. Skating and Ski-ing Championships.

Initial championships for skating and ski-ing open to all serving and reserve officers of the R.A.F., will be held at Maloja, Switzerland, on Jan. 29 (skating) and Jan. 30 (ski-ing). A cup will be competed for in each event. The skating cup will not be competed for unless at least ten entries are received.

Full particulars may be obtained from E. Weatherall, Esq., 1, Gower Mews, Bedford Square, London, W.C.1, to whom intending competitors should make early application.

If sufficient support is forthcoming, it is intended to form a R.A.F. Skating and Ski-ing Association at a later date. This will depend largely on the degree of interest aroused by the prospective initial championships.

MALTA HARBOUR.

In the House of Commons on Nov. 27, replying to Rear Admiral Sueter, the Under-Secretary of State for Air said that the suggestion that the Air Ministry and Admiralty should confer to ascertain if any form of breakwater could be provided in one of the harbours to afford protection in bad weather to flying-boats using Malta, would be carefully considered. But the information available strongly indicated that any substantial improvement of the facilities for the operation of flying-boats at Malta by means of a breakwater, could only be effected at a practically prohibitive cost.

U.S. AIRCRAFT CARRIERS.

The Times of Dec. 2 states:—

In a recent broadcast address from Pittsburgh, on the occasion of the birthday of Commander R. E. Byrd, U.S.N., Rear-Admiral W. A. Moffett, Chief of the Bureau of Naval Aeronautics in the United States Navy Department, expressed the view that aircraft carriers were the most valuable vessels in the Navy to-day. The *Lexington* and the *Saratoga* had been in commision for a year, and valuable experience had been gained with them in the use of large numbers of aircraft with the Fleet, especially in strategical and tactical manœuvres.

Last year 84 aircraft took off from the *Saratoga* at 3.40 in the morning, 140 nautical miles from the Canal, and succeeded in attacking it and returning to the ship without a casualty. The Department has asked for five carriers of 13,800 tons; one has been authorised, and Rear-Admiral Moffett hopes the others will be granted soon.

THE "GRAF ZEPPELIN."

Since its first flight in September, 1928, the *Graf Zeppelin* has flown 73,000 miles. The ship has now been taken temporarily out of service for overhaul and adjustment.

IN THEIR HABIT AS THEY LIVE.—A group of R.A.F. Officers from the Engineering Course, Home Aircraft Depot, R.A.F. Henlow, taken with a Westland Four (three Cirrus-Hermes engines) during a professional visit to the Westland Works at Yeovil.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS

(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

POLAR FLYING.

On Nov. 29, at 3.29 a.m. (G.M.T.), Commander Byrd, Mr. Bernt Balchen (pilot), Mr. Harold June (wireless operator), and Capt. Ashley C. McKinly (cinematographer), started on a flight to the South Pole. The expedition reached the Pole and returned to their base the same day. The distance covered was about 1,600 miles.

One account says that the machine on the return trip had to refuel from a dump 400 miles away from Little America on the Ross Sea where the expedition is based. The aircraft used was a Ford Trimotor, the *Floyd Bennett*.

The President of the United States, Mr. Hoover, has sent a telegram of congratulation to Cmdr. Byrd and his companions.

In 1926, on May 9, Cmdr. Byrd and Mr. Floyd Bennett flew over the North Pole, starting from and returning to Spitzbergen. The aircraft was a Fokker, with three Wright Whirlwinds.

On June 29-July 1 Cmdr. Byrd, with Mr. Bernt Balchen and two others, flew the Atlantic from Long Island to the French coast.

Sir Hubert Wilkins is also in Antarctica. His base is on Deception Island, 90 deg. of longitude west of Little America and south of Tierra del Fuego. This expedition also has aircraft.

In 1926 Sir Hubert Wilkins and Lt. Eielson flew across the North Pole from Pt. Barrow, Alaska, to Spitzbergen. Their machine was a Lockheed Vega.

Lt. Eielson, who is no longer with Sir Hubert Wilkins, has been missing since Nov. 9, when he started to fly to the help of the s.s. *Nanuk*, which is frozen in the ice off North Cape, Siberia.

Lord Thomson, Secretary of State for Air, has sent the following message to Commander Byrd:—

On behalf of Air Council tender hearty congratulations to yourself and companions on splendid flight over South Pole.

In the words of the famous Mandarin, when he first saw an aeroplane and was asked to wonder at it,—"But why? It was meant to do that, wasn't it?"

An aeroplane flies just as well in Arctic or Antarctic air as any other, and rather better because the engine keeps cooler. So why congratulate a Polar flier and not every French pilot who crosses the Rio del Oro area on the Latercoère line. His risks are just about as great, and his work is rather more useful.—C. G. G.

Major Tryggve Gran comments in the Copenhagen newspaper *Ekstrabladet* as follows on Cmdr. Byrd's latest achievement:—

I am not justified in saying that Commander Byrd did not pass over the South Pole, but the whole expedition appears to be a speculation in sensations.

After the way in which Americans are acting, the name "Polar explorer" is no longer an honourable name. Scientific qualities are no longer required, nor are year-long preparations. To become a Polar explorer money only is required.

Commander Byrd's report on the flight across the South Pole does not seem to inspire confidence. He says he saw plainly Scott's and Amundsen's cairns, erected in December 1911 and January 1912. In my opinion it would be nothing short of a miracle if these cairns were still so well-preserved that they were visible from the air against the white snow plain.

The terrible mountains which Commander Byrd describes are fantasy. I discussed thoroughly with Amundsen the character of the landscape, and on the whole of the long last stretch to the South Pole of Scott's and Amundsen's routes there were no mountains.

When we returned from Scott's expedition we agreed that the trip might be made by motor-cycle. Naturally there are clefts and ravines, which must be crossed or got round, but the land is, on the whole, a plain.

A NEW POWER IN THE LAND.

By the acquisition of a controlling interest in Simmonds Aircraft Limited, another large financial Group, the Whitehall Securities Corporation Ltd., which is associated with S. Pearson and Son Ltd., the great engineering firm, and is commonly known as the Cowdray Group, has entered the field of aircraft construction.

Simmonds Aircraft Ltd., though only formed in September 1928, has built a number of the Spartan 2- and 3-seater light aeroplanes, with the Cirrus or Hermes engines, and the interchangeable wing, which is already World-famous. Since the incorporation of the Company development has been rapid, and aircraft of this type have been in use on the Continent of Europe, in Canada, America, South Africa, Australia and New Zealand.

The machine, designed by Mr. O. E. Simmonds, A.F.R.Ae.S., M.I.Ae.E., has features of great interest. Its chief characteristics are great strength in construction and the principles of the interchangeable wings and interchangeable parts of the tail unit. This interchangeability is produced under the patents owned by the Simmonds Interchangeable Wing Co. Ltd., which rights have also been acquired by the above-mentioned financial group.

At the present time the Spartan Biplane is being produced in two types—a 2-seater sports and training machine, and a 3-seater light aeroplane, both with the Hermes engine. They have an aerobatic certificate of 1,680 lbs.

The intention is to register a new company in the near future to carry on and develop the business of Simmonds Aircraft Ltd. and the Simmonds Interchangeable Wing Co. Ltd. Among its Directors will be Capt. H. H. Balfour, M.C., M.P., and Lt. Col. L. A. Strange, D.S.O., M.C., D.F.C., both of whom are well known in aviation circles. Mr. O. E. Simmonds, who will be remembered as having had a considerable share in designing the Supermarine-Napier S.5 which won the Schneider Trophy Contest of 1927 at Venice, will also be on the Board.

THE RETURN TO ITHACA.

MM. Costes and Bellonte returned to Paris after their Odyssean wanderings on Nov. 21. Quite apart from the enormous distance covered non-stop by the *Super-Bidon*, the pilots have covered quite a large portion of the World's surface. They flew to Tsitihar by Siberia and came back to Paris in six stages by Tokio, Indo-China, India, Asia Minor and the Mediterranean.

Their distance record has not yet been homologated by the F.A.I.

HOME AGAIN.—The return of MM. Costes and Bellonte at Le Bourgêt, after their 6,000 mile non-stop flight to Siberia, which, when homologated, will be the World's Distance Record.

THE PULLMAN OF THE SKIES

The Avro 10 is the British version of the Fokker F7-3M. It embodies all that is excellent in modern air travel, comfort, speed and great reliability under all climatic conditions. It is equipped with three 230 h.p. Armstrong-Siddeley engines and the whole machine is British built to the Air Ministry's standard of airworthiness. This type is used by the Dutch, Swiss, Italian and Canadian air lines and has recently been selected for passenger and freight service by Australian National Airways Ltd., who have ordered four Avro 10's for passenger and freight traffic on their Brisbane to Sidney route.

AVRO·10

Cruising speed 100 m.p.h. **Range from 400 miles upwards.**
Payload up to 2000 lbs.

Specifications and full particulars both of the above plane and of the Avro 5 (seating pilot and four passengers) will be supplied on application. Those interested should write also for special catalogue of the famous "Avian" light aeroplane.

THE PRIVATE OWNER'S POINT OF VIEW.

A lecture of great potential value to manufacturers and esigners of civil aeroplanes, as well as to private owners of lanes, was given by Sq. Ldr. H. M. Probyn, D.S.O., to the oyal Aeronautical Society on Nov. 28, on "Flying and Mainenance from the Owner's Point of View." In spite of its value here was only a small gathering and the Trade with a few otable exceptions was remarkable for its absence.

The lecturer opened by apologising for the simple way he had tackled his subject and explained that he had tried to nclude things of interest both to those who knew more bout private flying than he did and to those with little or o experience. He made the sound remark that it is the mall and simple things which go to make for safety, comort and efficiency.

There is only one safe place for speed and that is in he air where other people are not thereby inconvenienced. Aircraft are remarkably useful as transport where rivernouths and similar inlets have to be traversed. Motors or rains have to circumnavigate such obstructions, the aeroplane just flies over the top. A case in point is that the ecturer's home is at Colchester and he can reach it from his Squadron at Manston in ¾ hour by air.

Once in the air, flying is much less fatiguing than driving a car. The rudder is the only control that needs attention and this could be made unnecessary by the employment of some spring-loading device. The other day the lecturer, who owns a Westland Widgeon with an Armstrong Siddeley Genet engine, flew from Manston to Hamble, some eighty miles, without touching the control column until coming in to land.

Sq. Ldr. Probyn's definition of a good pilot is one who never breaks anything. The age limit varies with the individual but any man or woman who has lived a good outdoor life should have no difficulty in learning to fly up to the age of sixty. [A case in point is Mr. Richardson of the Norfolk and Norwich Club, who recently flew across the North Sea and back in his Klemm (40 h.p. Salmson) and afterwards to Paris.—T. J.]

A young man has quicker reactions and possibly more skill than a middle-aged man but the latter is less likely to break anything. The middle-aged man is more likely to know something about the weather. In any case to fly one must have good eyesight, with or without glasses.

Although a pilot may learn to go solo in three hours, instruction must continue for some time after this stage before the pilot is fit to go across country and meet average British weather conditions. 100 hours' experience is a dangerous time. At 500 hours a pilot begins to know how little he knew at 100. And at 3,000 he is still learning.

The stall, or lack of air speed, is responsible for the majority of accidents to private owners and this type of accident with the exception of collisions always has the most serious results. The Handley Page slot is a safeguard against spinning, but that is not enough,—prevention is required.

Sq. Ldr. Probyn wishes to emphasise the fact that some warning device is essential, and particularly quotes the Bramson-Savage anti-stall gear. He tried out this device some years ago and found it excellent, although not then mechanically perfect. Old pilots say that if a man needs a device of this kind he ought not to fly, but we want to make flying easier. [Just so, old drivers say that four-wheel brakes and self-starters, and oil-indicators, and other safety gadgets are not wanted. But without them there would be fewer motorists.—C. G. G.]

An anti-stall device must not rely on sight but must include some positive way of attracting the pilot's attention. Nobody stalls when he is looking at the instruments but when his attention is on something else. An audible device would be quite valuable.

The contention is always brought forward that pilots will get into the habit of relying on any such device and that it may break down. The same may be said of the engine.

Many people look upon slow landing as the panacea of all troubles in flying but there will always remain the pilot who lands down wind and whom nothing but a reverse-gear could save.

A knowledge of weather signs, wind, sea and country is necessary as well as flying technique. Herein lies the difference between driving and flying, the road sign gives way to the compass and map.

The various types of commercial aircraft of interest to the private owner may be divided up into four classes:—A, B, C, and D.

"A" includes Argosies, Herculeses, Singapores, Supermarines and similar craft, carrying twenty people or so. At least one pilot and two mechanics are necessary for this type of machine. At the moment this type of aircraft has not much appeal to the private owner. The quarters are too cramped for living on board. Prices range from £10,000 to £20,000.

"B" includes all four- to six-seater aircraft with one, two or three engines, which vary between 200 and 400 h.p. This type consists mostly of cabin monoplanes. A pilot-mechanic could look after any one of them. Prices from £2,700 to £5,000. [See page 1287.—C. G. G.]

This class, which generally has air-cooled engines, is very popular in America. It is likely to become popular here and in the Colonies as well. [Which is what THE AEROPLANE has been saying for years.—C. G. G.] The cabins are as comfortable as a car, though noisier. A trip to the Cape or Egypt in one of these machines would be more comfortable than any boat or train journey.

"C" includes all the machines of the two- or three-seat variety, with engines between 80 and 110 h.p. Prices between £630 and £800. This country undoubtedly gives the best value for money in this type, which is made as a biplane or monoplane, high or low wing, metal or wood, side by side or tandem-seating. This type can be maintained for a long time by the private owner him or her self.

The lecturer thinks that this is the lightest class which can be consistently and safely used in Great Britain. 1,000 lbs. loaded weight should be the minimum.

"D" covers the ultra-light aircraft of the single- or two-seat type ranging from 20 to 45 h.p. These are very economical to maintain. A machine of this type has flown to India and back. [A young German, Baron von Koenig-Warthausen, is flying round the World on a Klemm with a 20 h.p. Mercédés engine. He started from Berlin and has reached Detroit. The sea crossing from Singapore to San Francisco was made by boat.—T. J.]

Amphibians are not so popular as landplanes. One reason [and probably the only reason, as they enhance the usefulness of the machine.—T. J.] is their greater first cost. [The only amphibian gear on the British market for the "C" class costs as much as a "D" class machine.—T. J.]

Sq. Ldr. Probyn says that a light two-seat seaplane is of little use for alighting in the open sea on an average day, so one may as well use a landplane and save the weight. Where no landing grounds are available, such seaplanes are ideal

CLASS A.—A Short Calcutta (three geared Bristol Jupiters),—a pleasing air-yacht for any gentleman.

Digitized by Google

for alighting on sheltered lakes, rivers and harbours, for which a knowledge of sailing, currents, tides and charts is necessary.

Anyone contemplating buying an aeroplane generally knows what he wants it for, how much he is going to spend, where he is going to keep and house it. He knows the type of journey for which he wants the machine, whether he will use it for racing, whether he will do his own maintenance work and in what kind of weather he intends to fly.

All these questions affect the buying. For long journeys of 2,000 miles and upwards one needs a cruising speed of not less than 100 m.p.h. because of adverse winds,—which are the kind one generally meets.

The monoplane is probably the best proposition for the private owner owing to its simplicity and fewer moving parts. The lecturer says that there is not much in performance between the two, though the biplane is the stronger for aerobatics. The monoplane requires less maintenance and should be cheaper, but is not.

Side-by-side seating is a debatable advantage except in a cabin machine, when it is a convenience. The trouble with a high-wing monoplane is the chance of its being blown over in high wind when on the ground. The aircraft is fairly safe in such circumstances however if kept moving till in the lee of shelter.

There is room for both open and closed aircraft, but women passengers would prefer closed cabins with side-by-side seating. Sq. Ldr. Probyn is quite sure that within five years' time a two or three-seat side-by-side enclosed aircraft will be on the market selling for £650. There is already a machine of this type on the market selling for £750. [To wit, the Desoutter.—ED.]

Sq. Ldr. Probyn said that on the whole he would plump for a low-wing cantilever monoplane, air-cooled engine, enclosed cabin, side-by-side seating. Such a type is simple, easy to fly, has good visibility, and is less likely to overturn in a high wind. One objection is that owing to the low wing the ground must be clear of all obstacles more than 18 in. high.

Four and a half hours' fuel is necessary for travelling abroad, as landing grounds are sometimes 300 miles apart and in any case a journey out and back may easily be that distance. Never risk a forced landing owing to lack of petrol. Gravity feed and flexible piping make the ideal fuel system.

Refuelling is an important point, and though many aerodromes are now equipped with pumps, there are places where machines have to be fuelled from tins and then a small pump on the machine would be ideal.

Cubic capacity and not weight is the limiting factor in luggage accommodation on aircraft. Two people require not less than two suitcases each. These cases to weigh 22 lbs. each and to be 24 in. by 14 in. by 6 in. There must also be room for golf clubs or tennis rackets, as well as engine-covers, pegging-down gear, tools and spares. The majority of light aircraft are badly off in this respect.

Folding wings are an advantage to light aircraft. Damage to wing-tips owing to rough handling is a serious matter. The lecturer has had his smashed against hangar doors seven times. His attempts to make spring wing-tips have been only partially successful.

A small two-seat machine needs less maintenance than a car. The engine is more accessible and does not get so dirty nor does the air-frame (i.e., the aeroplane considered without the engine) require as much cleaning as the body work of a car. Most of the attention that is necessary for the air-frame is inspection.

Fabric parts other than fuselage covers should last about three years. The undercarriage requires inspection after a bad landing, and in any case every ten hours. Frayed wires, bent struts or axles, and loose nuts must be looked for.

Greasing should be done as laid down in the manufacturer's handbook. The bolts fastening the locking-cap or washer which holds the wheel in place should be examined frequently. The undercarriage fittings to the fuselage should be inspected with the undercarriage. The tail-skid should be examined for weak spring, frayed shock-absorber, damaged shoe, and loose nuts.

Inspection of the controls should start with the control-column. The universal joint at the bottom of this should be examined for slackness and wear. This must be greased.

The controls must then be followed out to their various surfaces. Hinges of these parts should be inspected and oiled every twenty hours.

Another important thing is to inspect all piping, for a broken pipe may easily entail a forced landing. All pipes and wires must be protected against rubbing.

Cleaning is done by washing down fabric parts with hot water and soap. The cockpit is brushed out.

The lecturer uses two belts, one for use in rough weather to fasten him to the seat and the other to prevent him being thrown forward in the event of a crash.

All metal-work should be examined for rust and corrosion. Duralumin fittings are particularly apt to corrode if near the sea.

Annually during the first two years, wings, if fabric-covered, must be cut to inspect the bracing wires. After three years they may require re-covering. Ply-wood should be examined to see the effect of damp and whether struts and longerons are coming away from it. Look for elongated holes in fittings where there is movement.

Metal fuselages can be inspected easily, but the covers are an extra maintenance compared with a ply-wood fuselage. On the other hand, this type of fuselage is probably better in extreme climates, though the lecturer is still a little dubious of rust in steel. Ply-wood fuselages and covered wings have given good service in all countries.

Engines on private aircraft are mostly air-cooled and usually run 150 hours without trouble or decarbonising. Anyone with a knowledge of a motor-cycle can top-overhaul the average light aero-engine.

All oil-filters should be examined every twenty hours, and more often if oil is not filtered before being put in. The

CLASS B.—An Australian-built D.H.50 (450 h.p. geared Jupiter). Produced by Qantas Ltd. and named "Hippomenes,"— a useful cabin machine.

Digitized by Google

Digitized by Google

scavenger or sump filter should give one a good idea of the internal condition of the engine. Incidentally a mineral oil is easier to clean off than a castor oil.

The revolution indicator can tell you whether the engine is giving full power on each magneto. An oil thermometer is worth the expense of fitting on an air-cooled engine. An important inspection is that of earth and switch wires, which become hardened through vibration.

The standard R.A.E. petrol filter is a good one, and if the fuel is filtered before being put in the tank, this filter will only require dismantling every twenty hours.

Tappets and rods must be examined, greased and adjusted every ten hours. A greasing device in the rod itself is desirable. Rocker-arms, depending on whether they are plain or ball-bearing, must be greased every 6 to 20 hours. Sparking plugs must be stripped, cleaned and adjusted every twenty hours. This is the longest job on the engine.

Contact-breakers should be cleaned of oil and moisture, points examined and adjusted. The contact-breaker cover must be put properly home. Carburettors do not give much trouble. The lecturer has the main jet out every 50 hours.

The air-screw boss should be tight on its shaft and the bolts fastening the airscrew to the boss watched for a red rust powder. A solid metal airscrew is safer to swing, though expensive and heavy. On tour he carries a spare wooden one. The lecturer swings the airscrew from behind and has an extra switch outside the fuselage. In a cabin aircraft the airscrew should be started either from inside the cabin or by means of an inertia starter.

Great Britain is a small country and poorly equipped with civil aerodromes. Numbers of interesting towns have no landing grounds. It is not the best of flying countries, although the scenery is certainly among the best in the world. The climate, despite the recent Summer, is poor, as we get a high percentage of mists, low clouds and high winds. A pilot who flies well in England will have no difficulty in other countries. Five hours' flying a day is the maximum for pleasure.

France is the ideal touring ground for the light aeroplane. Housing and landing is very cheap. Petrol and oil cost much the same as in England. Hotels and transport are much cheaper than at home. One requires a triptique costing 25s., obtainable from the Royal Aero Club, or the Automobile Association, a passbook and a journey log-book. £3 10s. per day for two people will cover a tour in France. This includes petrol, oil, and aerodrome charges for 300 miles' flying every fourth or fifth day.

A tour of 4,000 miles requires planning ahead. Extra engine and machine-spares may be necessary.

Winter flying requires good warm clothes, and in the lecturer's machine the passenger's cockpit is completely enclosed with a sliding celluloid roof. Lined trousers like a Sidcot, and a lined trench-coat, would be an improvement on a flying suit.

A good set of tools is essential, as well as a few special ones, together with odd nuts and the like. Engine and cockpit covers with press-on eyes are quick to put on. A means of lashing the control stick should be standard. Good picketing gear is essential. Two sacks that can be hooked onto the wings and a shovel with which to fill them are best.

Aerodromes should give one a choice of fuel, not everyone can afford aviation petrol, and it is not necessary. The lecturer uses No. 1 M.T. benzole mixture when he can obtain it. It often pays to bring one's fuel from the local garage.

A good compass properly swung is a necessity. So are a good watch and maps. A Véry pistol and lights are useful to get wind-direction in a sea-crossing or in a hurried forced landing, and also to get help. The maps should be good and have not too small a scale, which can range from ten miles to four miles an inch according to circumstances. A time-table when flying is a necessity. Flying round an aerodrome and having a good look-see before landing is always worth while.

There is an old tag invaluable for cloud flying which says: "When in clouds press your compass and follow the bubble." Thus if the right side of the compass card or needle comes towards you it is pressed away with right rudder and *vice-versa*. This prevents the machine from swinging. If the inclinometer bubble moves left the stick should follow proportionately in the same direction, and *vice-versa*. If the air speed is kept constant at touring speed the machine will be level fore and aft. When making out a compass course, magnetic variation must be taken into consideration.

Sq. Ldr. Probyn uses a simple drift-sight consisting of painted lines on the starboard strut of his monoplane worked out to 25 deg. Port and Starboard. Cloud shadows on the ground give one an idea of wind velocity and direction. At times they are a guide to the best height at which to fly. For a long trip, water, and rations such as biscuits, cheese and alcohol, are useful.

There is not much necessity for the private owner to use his aeroplane at night. On a moonlight night flying can be very pleasant. Landing by searchlight is no more difficult than landing by day. Landing by paraffin flares, one invariably undershoots and flies into the ground, therefore one should land with a little engine on.

Photography from the air is very interesting, and Williamsons make a special camera for this sort of work for operation by the pilot. The lecturer has obtained good results with a Baby Pathé Cinema. A colour filter should be used on all cameras for this work, and it should have a large aperture and narrow angle.

Sqd. Ldr. Probyn gives some interesting running costs based on a year's flying of 150 hours. These costs are as follow:—

	"B" class costing £3,700.	"C" class costing £650.	"D" class costing £400
Depreciation	£740 0 0	£130 0 0	£80 0 0
Insurance (flight risks) ..	296 0 0	50 0 0	40 0 0
,, (third party) ..	15 0 0	10 0 0	10 0 0
Housing	100 0 0	50 0 0	40 0 0
Fuel	151 17 6	50 12 6	25 6 3

The lecturer closed his paper with some suggested improvements on present design. Noise from the exhaust can be diminished by fitting a silencer, but airscrew noise will last till we have geared engines.

Brakes are necessary. Sq. Ldr. Probyn intends to try out a parachute brake attached to the fuselage. This would be for emergencies only. He found that he could fly out of lots of places in which he could not land.

He favours large-diameter tyres with low pressures. Experimenting with a Bristol Fighter and pulling it over on to one wing tip while on the ground he found that the shock-absorber gave 1 in. and the tyres 2½ in.

Celluloid is not good enough for windscreens. They should be of glass. A reliable wiper is a necessity. Goggles are useless after half an hour's rain.

Parachutes are expensive and uncomfortable. Sq. Ldr. Probyn says that the broad belt pack type (like the Salvator) seems simple, quick to put on, and comfortable.

The autogyro should go far to make landing and flying easier for the beginner. The old De Havilland Six would be very nearly suitable for those people who would like to take the air only on a fine evening.

Finally, by means of a drawing of a Delanne low-wing cantilever monoplane, the lecturer outlined his ideal. A low cantilever wing with a cabin for three on top of it. Pusher airscrew at back. Outrigger booms to carry the tail unit. A central landing wheel of large diameter and section built into the bottom of the fuselage. Retractable auxiliary wheels might be used to obtain stability at rest and at low speeds

CLASS C.—A range of De Havilland Moths (Cirrus III engines) for National Flying Services Ltd.

When You Are Flying Over Unfamiliar Ground

or when landmarks are obscured, you can always rely on the Pioneer Magnetic Compass

Pioneer Magnetic Compass
Actual Size

Depth—face to rear—
3½" without electric light
4⅜" with electric light
Weight complete, 2 pounds

Since its organization on March 1, 1919, the Pioneer Instrument Company has devoted itself exclusively to the design, development and manufacture of aircraft instruments and equipment.

Pioneer Compasses have been the accepted American standard for the past ten years. The model illustrated is the result of years of development in the laboratory and in the air.

New features are: the round dial type of mounting, making the compass uniform in appearance with the new standard size Pioneer Instruments; an improved resilient mount which effectively insulates the Compass against engine vibration; a concealed internal electric illumination system; and the Titterington Micrometer Compensator which permits compensation to be made with a few turns of a screw driver.

Ask us to send literature illustrating and describing the latest developments in modern Aircraft Instruments. Our line covers all your requirements.

THE DISCUSSION.

MR. WIMPERIS, Director of Scientific Research at the Air Ministry, was in the chair and said that this paper was full of facts and useful experiences. He thought that everybody at the lecture would like to see the first attempt with the parachute brake. He called on Mr. Butler to start,—

MR. ALAN BUTLER, Chairman of the De Havilland Co., said it was a little difficult to criticise a paper which had obviously received so much consideration from its author. He disagreed about the necessity for side-by-side seating, as people could be put so close together in tandem cockpits that it did not matter. Taking the Moth or "C" class, he thought that the most important points in order of merit were: Forward and downward view, speed, range, lack of noise, self-starter, and brakes.

He thought that some form of starting gear was essential and that the airscrew should not be touched by hand. The earthing switch was archaic and should be replaced by some other device. He thought that spring fasteners were better for covers than spring clips.

A compass was essential. He also found cloud shadows useful for estimating drift. His own experience was that it was easier to get into fields than to get out. He disagreed from Sq. Ldr. Probyn about shock absorbers, which he thought were essential.

SIR SEFTON BRANCKER, Director of Civil Aviation, agreed with everything the lecturer had said, and added that he was all for side-by-side seating. No one wished to scream down a speaking-tube to a charming companion. He thought that for school work the undercarriage travel on a Moth was not enough. Shock-absorbers were essential.

The side-by-side pusher should have a removable top. Aircraft should be sold with integrally built suitcases. Long-range tanks were essential. He disliked a flight in which one doubted whether darkness, the petrol, or the aerodrome was going to win. He advocated the pusher type. Noise was being investigated by the Advisory Committee. He thought that most of it came from the airscrew.

He thought it was up to Dr. Merton (Chairman of the Committee of the Air League) to find a larger audience for Sq. Ldr. Probyn.

CAPT. GEOFFREY DE HAVILLAND thought that people should fly by instruments, because "flying by instinct" really meant flying by vision, and when that was removed, as in fog, "instinct" had gone. He referred to the difficulty of choosing between wood and metal structures. The trouble with side-by-side seating was that it reduced performance, and sociability could be got in tandem. The use of a low wing meant the employment of petrol pumps. He referred to the fact that light aeroplanes could land, in case of need, without a rudder or even with one elevator gone. The most important things therefore to inspect were the ailerons. A starter could not be included without the addition of 30 or 40 lbs. Brakes were useless on wet grass, when one could slide further with locked wheels than the length of the normal run. [But grass is not always wet.—ED.] He did not think that the development of the De H. 6 was really worth while, as so few people would require it.

DR. MERTON, Chairman of the Committee of the Air League, said he thought that as the three-engined aircraft had proved their worth on air-lines, the type could be developed with advantage for the light aeroplane and private owner. He used a method of drift lines similar to that of the lecturer, only his were painted on the plane. A time-table was very valuable. He found that a light filter was not necessary on a camera if used below 1,500 ft. He had cut down exhaust noise by a half when he fitted a silencer. He had kept a careful record of costs since he purchased his Moth in 1927, and found that running costs were about 16s. per hour. He found that a year's flying cost £420 on the lecturer's scale, and not £320. His own 100 hours cost him about £250.

He thought there was need for a special machine for the Colonies, which would be cheap to maintain and repair. No part of it should be too big to be flown out in sections in a machine of its own type.

SQ. LDR. ENGLAND of Handley Page Ltd. referred to warning devices and said he thought that the number of instruments should not grow. He said the time was coming when it would be possible to regain control after dropping 60 ft. Insurance was necessary, but costs would have to come down. He referred to a friend who purchased a machine after 15 hours' flying, and had to pay £25 for Third Party Insurance and £105 for the machine. The most important view was the upward one when turning and this you could not get in a high-wing cabin machine. He referred to the use of elastic cords to make flexible wing-tips. Slots and brakes were essential. He thought night flying was important, as he did not see why private owners had to home before dark.

MR. BRAMSON gave his view of the most important features for light aeroplanes, which were safety first (this meant good visibility) and freedom from forced landings (which might make two engines necessary). He was glad to hear such nice remarks about the Bramson-Savage anti-stall gear, although he had kept quiet about it for two or three years.

MR. RATCLIFFE, who is chief draughtsman on the commercial side at Westlands, said that a monoplane had to be built to meet Air Ministry requirements, and therefore was as strong as a biplane for aerobatics. Pilots had told him that "B" class machines were easier to fly than two-seat machines.

MR. WIMPERIS gave some interesting details about the work of the Panel which is investigating noise. They had succeeded in finding some sort of unit with which to measure noise. Aircraft noise came from the two sources,—airscrew and engine. To illustrate the difficulty of the subject he said that if one had two dogs equal distances away from the instrument and both making the same amount of noise, if one dog stopped that only reduced the noise from 80 units to 77. He said that a three-seat pusher machine of Captain Hill's Pterodactyl type was being built by Westlands. He referred to his recent trip in Canada, when he had been struck by the large number of flying boats in use—nearly all American-built—for holidaying on the Lakes.

SQ. LDR. PROBYN said in his reply that the visibility in the Delanne was good in all directions. Safety first was the most important feature. He thought that a 3-in. travel could be obtained with a Goodyear Airwheel, and this was ample for an experienced pilot. The Salvator parachute was much more comfortable than the Irving. His own machine carried its own weight in useful load. He referred guardedly to his experiences with the automatic pilot (George), and said it was uncanny. He thought Capt. de Havilland's remarks about wheel-brakes emphasised the need of a parachute brake as he had suggested. Insurance naturally varied with the pilot. It was much cheaper to house an aeroplane in France than to garage a car. He thought it was easier to taxi without slots. Two engines might be safer, but they would be too much trouble. Sparking plugs for one engine were too much trouble to keep clean as it was.

THE DEVELOPMENT OF AIRCRAFT MATERIALS.

A lecture which will be of special interest to aircraft and aero-engine designers and manufacturers will be given by Dr. Rosenhain, before the Royal Aeronautical Society, at 18, John Street, Adelphi, on Dec. 12, at 6.30 p.m.

The lecture will include a survey of all the materials used in the construction of aircraft. An account will be given of some alloys which have exceptional strength at higher temperatures. Something will be said about the ultra-light metals like magnesium and beryllium.

CLASS D.—The Hendy Hobo (A.B.C. Scorpion), which comes into Squadron Leader Probyn's last category.

The Cinque Ports Flying Club uses Wakefield CASTROL XXL exclusively—

Here is their letter to us:

LYMPNE AERODROME
KENT
18th Nov., 1929

Messrs. C. C. Wakefield & Co., Ltd.

Dear Sirs,

This Club keeps a very careful check upon the figures for oil consumption of the Club aircraft. As you know, we use your Castrol XXL exclusively, and we feel that you would like to know that this has proved to be extremely economical and also very efficient.

During the three months ending 31st October, neither of our Club aircraft exceeded a consumption of one quart per hour. Our aircraft G: EBRI (which is used practically exclusively for dual instruction) has always proved the more economical of the two. The consumption figures for both aircraft are as follows:—

		G: EBRI	G: EBPM	
August	—	.406	.753	quart per hour
Sept.	—	.629	.859	" " "
Oct.	—	.499	.772	" " "

The average flying time put in by each aircraft during each month was over 50 hours. Our Ground Engineer considers these figures very satisfactory for the Mark II Cirrus engines, and we feel that is especially so when it is considered that the aircraft are used exclusively for instructional purposes involving continual landings and take-offs.

Yours faithfully, p.p. CINQUE PORTS FLYING CLUB, LTD.
(Signed) R. Dallas Brett, Hon. Sec.

—and consumes less than a pint per hour in a CIRRUS Mk. II Engine!

C. C. WAKEFIELD & CO., LTD., All-British Firm,
Wakefield House, Cheapside, London, E.C.2.

THE KOOLHOVEN F.K.40.

CLEANLINESS.—A front view of the new Koolhoven, Class B, transport machine.

Mr. Frederick Koolhoven, who is well-known in this country as the designer of several war and post-war aircraft of high character, built by British firms, has lately produced a six-seat commercial monoplane with a 230 h.p. Gnôme-Rhône Titan engine.

The first of the type, which is known as the F.K.40, has been delivered to the Koninklijke Luchtvaart Maatschappij (K.L.M. or Royal Dutch Air Lines) and the machine illustrated has been furnished to suit the requirements of this company.

The F.K.40 has been designed as a General Purposes Commercial monoplane, and may be supplied with various internal arrangements.

It can be used as an ordinary four-passenger monoplane with a crew of two in a separate pilot's compartment forward of the wing. It is in this form that it has been supplied to K.L.M.

It can be used as a mail or freight carrier, and then the cabin can be boarded up. With the cabin thus arranged the machine has, together with the baggage compartment aft of the cabin, a cubic capacity of 190 cub. feet. When so used a crew of either one or two may be carried, with either single central, or side-by-side dual control.

It can also be supplied as a six-seater, with the pilot seated centrally in the forepart of the cabin.

Finally it can be arranged as a luxurious private touring monoplane with three lounge seats, luggage nets, a passage forward to the pilot's compartment, and a passage aft to a lavatory at the back of the cabin.

The F.K.40 conforms to the very high load factors demanded by the extremely stringent rules of the Dutch authorities, and, arranged as a single-pilot machine, it is claimed that it is lighter, and for its horse-power transports more load at a greater speed, than any other existing aeroplane with accommodation of equal cubic capacity and equal horse-power.

SPECIFICATION.

TYPE.—Four/six-passenger cabin monoplane.

WING.—Cantilever monoplane of tapering chord and thickness bolted direct to the top of the fuselage. Structure consists of two silver spruce box spars, of which the stringers are laminated and glued up with casein glue and normal ribs, the whole being covered with plywood. Ailerons of narrow and constant chord operated by rigid duralumin tubes.

FUSELAGE.—Rectangular welded steel-tube structure covered with fabric.

TAIL UNIT.—Normal monoplane type. Wooden tail-plane and metal framed elevators, fin and rudder. Adjustable tail-plane.

UNDERCARRIAGE.—Divided type. Each unit consists of a long vertical oleo leg running down from the front wing spar with the bottom end hinged to the bottom fuselage longeron by a steel-tube [illegible]. If fitted with wheel-brakes normal tail-skid replaced by tail-wheel.

POWER PLANT.—One 230 h.p. Gnôme-Rhône Titan five-cylinder radial air-cooled engine on a detachable engine mounting and cowled with quickly detachable cowling panels. Main fuel tank flexibly mounted in centre section of wing between the spars. Feed to the engine by gravity and fuel passes through a large approved filter. Oil circuit has two extra filters.

ACCOMMODATION.—Pilot's cockpit in front of leading edge of wing and is enclosed. This compartment may accommodate one or two and either single or dual control may be fitted. Below wing is a passenger cabin which may be arranged to accommodate three passengers or may be arranged as a freight or mail compartment. Behind cabin is a luggage compartment with a separate outside door. Cabin dimensions: 6.9 ft. long by 3.6 ft. wide by 5.4 ft. high. Cub. capacity: 134 sq. ft. Luggage compartment dimensions: 2.88 ft. long by 3.49 ft. wide by 5.77 ft. high. Cub. capacity: 58 sq. ft.

DIMENSIONS.—Span 20.12 m. (66 ft.), Length 11.125 m. (36.5 ft.). Height 3.40 m. (11.15 ft.).

WEIGHTS.—Weight empty 950 kgs. (2,090 lbs.), Weight of cabin installation 50-250 kgs. (110 lbs.-552 lbs.), Disposable load 700-900 kgs. (1,532 lbs.-1,985 lbs.), Weight loaded 1,900 kgs. (4,200 lbs.).

PERFORMANCE.—Speed, maximum, 187 km.p.h. (116 m.p.h.), Cruising speed (195 h.p.) 165 km.p.h. (102 m.p.h.), Landing speed 90 km. (56 m.p.h.), Initial rate of climb 132 m. min. (433 ft./min.) Climb to 1,000 m. (3,280 ft.) 9 min. 50 sec.

Mr. Koolhoven is ready to sell the complete designs to any British firm on reasonable terms. The success of the Desoutter monoplane, modified from Mr. Koolhoven's designs to suit Air Ministry requirements, is evidence of the possibilities of these machines.

AN AERO CLUB IN THE WEST INDIES.

An Aero Club has been formed in Martinique, French West Indies. It is known as the *Aéro-Club des Antilles*. Général Girod, who is President of the Club, is resident in Paris and he has brought pressure to bear on the Ministries of Air and Colonies with the result that these bodies have agreed to send to the Club a demonstration aircraft, two aero-engines and a set of instruments. This will be followed later by a further aircraft.

The Governor of Martinique has granted the Club a sum of 50,000 francs (roughly £400).

WHAT THE MARKET WANTS.—The latest Koolhoven Civil Air Transport monoplane. A type not built in England, but ready to be built by any firm which cares to buy the designs.

TWELVE CHAPTERS IN SEARCH OF AN AUTHOR?

[*The Air Traveller's Guide to Europe.* By Captain Norman Macmillan, M.C., A.F.C. Duckworth. The Aeroplane Book Department, Cannon House, Pilgrim Street, E.C.4. 10s. net.]

Captain Norman Macmillan has given us two delightful books, *The Art of Flying* and *Into the Blue.* He could count on our opening a third with eagerness. Now, however, that I have read it, I am almost certain that he did not write it—at least, not all of it. *Style, c'est l'homme,* and this is not the man.

I will concede that he compiled it and did it brilliantly. It would be impossible to find all the information that he sets out so clearly and so availably in any other work. It is really a catalogue of all the Air Lines of Europe, the service, the fares, the machines and engines they use and all the Air Stations. There are some very good photographs and some maps that are too economical to be pleasant.

Although the book is not intended for the sophisticated in aviation our own pilots will find in it many useful things. Our club-chair aviators and aerodrome loafers may be interested in the details of some air lines that are little heard of in this country. The book is addressed to those who have to travel on business or for their pleasure and to whom aerial transport is strange. I base this opinion on the following delightful little passages.

"The gentle undulation of a slight modulation in the air flow is a pleasure compared with the rocking of a train or the rolling of a ship." That is on page 21; on page 72, however, there is a change from poetry to prose. "There need be no fear of air-sickness, as it only happens with extremely bad weather *and is not as bad as sea-sickness.* (My italics.) Preventives of air sickness can be obtained at all aerodromes." Of course.

On the same page occurs the following. "Cotton-wool to stuff in the ears is provided for travellers to deaden the noise of the engines." In what country, do you think? But in Italy we go back to poetry. I quote from page 147: "The Adriatic is near, and above the sound of the motor one seems to hear the insistent song of the sea." *Seems* is good.

There are one or two paragraphs about safety that may come as a shock to some people. Since 1924 Deruluft, a Russo-German line, has only slightly injured two people, and the Czecho-Slovakian State Airline has had no accidents at all. I appeal to Spry to search all Croydon to find some boast to counter that.

In the preface, the author very properly protects himself from slight inaccuracies. He states, on page 34, that in 1924 the CIDNA air line was extended from Stamboul (which he dares to call Constantinople, contrary to Turkish law) to Angora. This was certainly not so last year, and is not mentioned in the latest Aerial A.B.C.

Again, the time taken to drive from the centre of most towns to their aerodromes is shown. For Vienna, this is given, on page 34, as 75 minutes, on page 110 as 50 minutes, and on page 153 as 15 minutes. I know all three to be wrong.

In connection with this it is interesting to note that it takes 75 minutes to reach the aerodrome from Marseilles, 90 minutes from Stamboul, and from Belgrade no time is very wisely given, perhaps because it cannot conveniently be stated in other than astronomical terms.

A large part of the book is given up to the description of various routes. This is where we miss Macmillan. For him to have travelled over them all would have been a task that only his worst enemy would have wished him to undertake. I take it that the descriptions were communicated to and amusingly selected by him. Some are undoubtedly better described than others.

The flight over the Karavanchen Alps (the picturesque spelling Karawanken is not employed) has inspired one writer to the lyrical height of 16,000 feet. Having done that journey in a Moth I can assure anyone that my sensations were quite different from those described in the book. It is during such periods that the magnificent new guarantee behind the Gipsy engine assumes a degree of dulness out of all relation to its importance. I am nevertheless grateful to be able to write this.

Some of the descriptions are lit by flashes of the obvious or of the incomprehensible that give considerable pleasure. Here is a dazzling account of the flight from Prague to Berlin (page 116): "We hurry over plains, over towns and villages, over forests, over a network of roads and railways, and after two hours' flying we sight Berlin. Shortly afterwards this city with its pulsating life is under us. . . ."

For highbrows, who hate the obvious, there is this description on page 112: "One sees the magnificent, frequently perpetuated panorama of Prague." I would have liked "Perpetually perpetuated."

There are notes on towns that have caught their authors a little short of inspiration. On page 54, for instance: "The Hague has witnessed tragedies that are historical, the execution of a Dutch Prime Minister upon a false charge of

Digitized by Google

conspiracy; death by violence from mob laws." Omitting the word "Dutch," you could apply that sentence to pretty well any town.

Riga is described as a typical, beautiful, old German town, and the catalogue of the sights to see, though it includes the post office and the theatre, omits the two most interesting buildings in the place—the Railway Station and the Club of the Blackheads. It is perhaps unfortunate that Riga is described as a great manufacturing centre on a page that faces an excellent air photograph of Essen.

The Balkan section provides, as you would expect, the best fun. What are Balkans for? The hand of the Treaty of Trianon lies heavy on these pages. Yugo-Slavia provides this exquisite sentence: "The National Aspirations of more than a thousand years have been filled to overflowing out of the lucky bag of war." The Yugo-Slavs were given some thousands of square miles of what was once the granary of Europe and belonged to Hungary. The Hungarian view, therefore, is different. "There is little wonder that the romantic, Eastern fatalism of her people, stoical in their Eastern loss of lands and ancient dignities, arouses sympathy in the eyes of more Western peoples."

As a joyous, light-hearted invitation to come and visit the jolly land of the Serbs, I accord this the Nobel prize "The charming hill-cupped town of Sarajevo where the murder of the Austrian Archduke and Archduchess precipitated the Great European War upon the World."

The book, you can see, is entertaining—and, after all, who are we to thank for it if not Captain Macmillan?—

BM/Ivor

THE GLIDING MOVEMENT.

THE GLIDING LUNCH.

The Gliding Lunch, which will have been held on Dec. 4 while this paper is being printed, will be reported in THE AEROPLANE of next week.

THE GLIDING DURATION RECORD.

The Gliding Duration Record was put up to 14 hrs. 43 mins. 25 secs. by Ober-Lt. Dinort on the night of Oct. 19-20, 1929, at Rossiten,—which is in East Prussia on the Baltic Coast. It is on the landward side of a long spit of land some 70 miles long which separates a large sheet of water (the Kurisches Haff), from the Baltic. At the North end of the Kurisches Haff, across the narrow entrance, is the city of Memel.

Rossitten and the Wasserkuppe in the Rhön Mountains, which are north-east of Frankfurt, form the two great gliding centres in Germany.

Ober-Lt. Dinort's glide started at 3.19 p.m. in a wind-velocity of 8 metres per sec. (26.2 ft. per sec. = 17.85 m.p.h.). As darkness came on people with electric torches were posted to mark the turning-points, one kilometre apart.

The wind was from the East so Lt. Dinort was flying along the landward side of the spit. A mechanical defect forced Lt. Dinort to descend.

At first sight this glider appears to be a retrograde step in design. It resembles the training type of glider and has a wing of low aspect ratio. There is a single spar and the leading edge is covered with ply-wood back to this spar.

The outrigger structure carrying the tail-unit and landing-skid on which the pilot sits is of steel-tube—presumably welded together.

The glider was specially designed by Ing. Schwabe and Ober-Lt. Dinort to fly in winds of low velocity up to 12 m./sec (39.4 ft./sec. = 26.85 m.p.h.). Actually during the record flight the wind reached a velocity of 20 m./sec.

The glider has been successfully launched on level ground by towing behind a motor.

DIMENSIONS.—Span 13.10 m. (43 ft. 0 in.), Chord 1.70 m. (5 ft. 7 in.), Length 7.50 m. (14 ft. 8 in.), Wing area 21.60 sq. m. (233.5 sq. ft.).

THE BOWLUS SAIL-PLANE.

A glider flown and designed by W. H. Bowlus flew for 1 hr. 20 mins. at San Diego in October of this year. This machine was built in the shops of The Airtech School of Aviation of San Diego, California. No particulars of the gliding ground are available.

The Bowlus sail-plane is a monoplane glider with a single seat. It resembles the German gliders but has a low aspect-ratio and a special form of aileron.

The wing is of the high cantilever type tapering in plan and chord and uses U.S.A. 35-A aerofoil section. The wing is in three sections. The centre section of 5 ft. span is attached to the main fuselage bulkheads, and the outer panels are each 19 ft. long.

The spars are built-up Pratt trusses with spruce flanges. The ribs have 1/16 in. ply-wood webs which is only ¾ in. deep and have flanges of 1/8 in. by 1/16 in. spruce. Every third rib is made a compression rib by spruce members glued onto the web.

The drag-bracing consists of spruce strips placed diagonally. The leading-edge back to the spar is covered with ply-wood. The whole wing is then covered with fabric.

The ailerons project beyond the wing-tip and are set at 6 deg. less angle of attack than the wing. The section used is Göttingen 410. They are built up with wood ribs, and are mounted on a duralumin tube 1¼ in. diam., which rotates in the end-ribs of the wing.

The fuselage consists of four spruce longerons, ¾ in. by ¾ in. at the pilot's seat and tapering to ⅜ in. by ⅜ in. at bow and stern. The struts are similar to the longerons. The diagonal braces are spruce strips 1½ in. wide by 1/16 in. Behind the pilot are two bulkheads of 3/16 in. plywood to take the front and rear spars. A skid is built into the bottom of the fuselage. The whole is covered with fabric. There are fairing strips to support the fabric covering.

The tail unit follows the German practice of having a very small fin, merely big enough to carry the rudder hinges, and no tail-plane. The rudder is balanced and its structure is like that of the wings. The elevator is like the rudder.

The pilot sits forward of the front bulkhead and has controls of the normal stick and rudder-bar type. The control wires are 1/16 in diam.

DIMENSIONS.—Span 44 ft., Chord at root 5 ft. 6 in., Chord at tip 32 in., Length 25 ft., Aspect ratio 11, Wing area 179 sq. ft.

WEIGHTS.—Weight empty 160 lbs., Pilot 170 lbs., Weight loaded 330 lbs., Wing loading 1.84 lbs./sq. ft.

PERFORMANCE.—Take-off speed 20 m.p.h.

THE RECORD BREAKER.—Ober-Lieut. Dinort and the glider on which he beat the Duration Record.

Item 1 : Seaworthiness in a sea of force 5 (Beaufort Scale) and a range of 4,000 km. with adequate payload being guaranteed at contract conclusion.

Item 2 : The boat being stranded on a storm-swept night (November 16/17th, 1928), without suffering the least injury.

Item 3 : Standing up excellently in official seaworthiness tests (sea of force 5), on December 11th and 13th, 1928.

Item 4 : Crowning acceptance flights by world's record: lifting a maximum payload of 6,450 kg. to a height of 2,000 m.

Item 5 : Flying ten hours non-stop from Travemünde to Stockholm and back by order of Deutsche Luft Hansa.

Item 6 : Flying non-stop over five countries, viz.: Germany (Travemünde) — Holland — England — Norway — Denmark and back to Travemünde airport, this flight also being made by order of Deutsche Luft Hansa.

The six foregoing feats prove the "ROHRBACH-ROMAR" to be the transocean flying-boat of the future.

THE PRESS VISIT TO R 100.

By L. HOWARD FLANDERS.

R 100.—The control-car which is, except for the power-cars, the only excrescence from the hull.

The Airship R 100 which is the second airship built under the 1924 programme, has been completed by The Airship Guarantee Co. Ltd., a subsidiary company of Vickers Ltd. It was taken over by the Air Ministry on November 22nd. On the 28th a Press visit was arranged.

While on the journey to Howden, the writer purchased Northern editions of certain well-known daily papers, and was able to read a full description of the visit that he was about to make. As this description did not appear in the London edition, it is probable that the police are more severe on clairvoyants and fortune-telling in London than in the North.

The dimensions of this airship are almost identical with those of R 101, but in spite of this the appearance is surprisingly different, and there will be little difficulty in identifying them when too far off to see the lettering.

The external differences of R 100 from R 101 are as follow: The mooring spindle with its attendant tubular bracing is external to the covering which ends in the bluff entry of a streamline form. The fabric covering is pulled in to keep it taut, which makes the polyhedral sides concave, and accentuates the prominence of the longitudinal girders.

There are only three power-cars. Each has two engines,

R 100.—One of the three power-cars, each of which contains two 650 h.p. Rolls-Royce Condor engines.

one of which drives a tractor the other a pusher airscrew. The power-cars are close to the hull with reasonable clearance for the airscrews.

The fins are thin and internally braced. The windows in the control-car and passenger accommodation are larger than in R 101, and gauze panels in each section of the hull give the appearance of passenger accommodation the full length of the hull.

Entrance is by way of the control-car and a ladder up to the crew's quarters.

The passenger accommodation follows marine practice, with a divided staircase and gallery round the dining saloon. The delightful large lounge on R 101 is replaced by a promenade each side on the same deck as the saloon, and a narrow promenade on the deck above. The "staterooms" are much larger than in the Government-built airship, they have comfortable berths with real spring mattresses, but most of them open off the saloon or the gallery. As the galley opens directly on the dining saloon the smell of cooking will pervade the whole of the accommodation, though of course this will save the weight of the menu cards. *There is no smoking room.* [The cramped space is

due to the fact that the Government contract demanded berths for many more people than could be got in R 101.—C. G. G.]

The comparison between the passenger accommodation in the two ships is interesting. One is like a cheap boarding-house, the other like a would-be fashionable hotel, both at a very select seaside resort which is hoping to have a promenade and a pier in a few years' time. D.O.R.A. lives at the one, and the other is not yet licensed.

We were invited to an excellent lunch by Lt.-Commander Sir Dennistoun Burney, Bart., the electric galley worked well, and the "Airship Nippies" who had formerly helped to build the ship showed that adaptability which becomes pioneers.

Major C. C. Turner said a few words on behalf of those present, thanking Sir Dennistoun Burney for his hospitality.

Commander Burney, replying, said that the ship was then lifting 30 tons of fuel and ballast, about 100 people, [about 7½ tons.—L. H. F.], and there were several tons additional load being used to moor the airship. This remark, he said, was to forestall the kind of people who would say that the ship could not lift off the ground.

He then expressed his appreciation of all those who had contributed to the design and construction, which had been drawn from many trades. He thanked the technical and operative staff, and said that there was a human as well as a technical side. R 100 was known as the "Cupid Ship," more than twenty weddings had occurred among the staff. [If you saw the country round Howden, and Goole, the nearest town, you would understand that there was no other entertainment available.—C. G. G.]

It was sad, now the ship was completed and the staff were being disbanded, that these new homes should be faced with the difficulties and hardships of unemployment, but he thought that it was inevitable that they should carry some of the burden of being pioneers.

Turning to the financial aspect of the airship, he said that Vickers Ltd. had always been to the fore in carrying out new work, but the Government must not expect the Engineering Industry to make a second contribution of this magnitude towards airship development. The Airship Guarantee Co.'s contribution in this case amounted to £150,000, to which must be added capital expended on the shed (£50,000).

The position in his opinion is that either the Government must spend about £3,000,000 on a 5 year programme or leave airship development alone, because considerable work and technical progress is needed before the airship can become an economic means of transport.

Commander Burney pointed out that the future of this country depends on making the Empire a political and economic entity, to which aim there are two great enemies, Time, and Distance. The Nation must give up attempting long-distance high-speed transport or must develop airships.

The only real defence against possible enemies is the economic power of the country. We are spending £120,000,000 a year on defences forces. A portion of this should be diverted to the real defence—the development of the economic power of the Empire by high-speed transport.

After lunch we continued the examination of the ship. The three power-cars are similar and interchangeable, each consist of three parts. The middle is rigidly braced to the hull. The forward part and rear part are bolted to the middle. Each end contains a Rolls-Royce Condor mark III B engine, complete with cowling, oil radiators etc. The rear engine in each car has a reverse gear.

Means are provided that, when the ship is at the mast, the engine sections can be lowered to the ground and replaced by others. The middle section contains a Bristol Gas Starter, and a retractable radiator common to both engines. There is plenty of room for two or three engineers, and a top overhaul while in flight should not be impossible, or even very difficult. [All these neat ideas are typical of the genius of Mr. Wallis, who designed the whole ship to be built out of only nine different components, multiplied thousands of times, thus making a mass-production job of one ship.—C. G. G.]

A very ingenious type of ladder which closes and becomes a streamline strut gives sheltered access to each power-car from the hull. These ladders, which may be opened by a handle at either end, open the hatchways at the same time as the ladder.

The six engines in three cars develop 4,000 h.p., of which half may be used for going astern. If the drag of R 100 is the same as R 101, the new ship should be 20 per cent faster with the increased engine power.

It may be recalled that this ship resembles the Zeppelin in the construction of those frames which are braced. In the German construction an "axial" wire takes any longitudinal component of the gas lift. In this ship there is an "axial" girder which takes this load, and at the rear end it is rigidly connected to the X frame which constitutes the spars for the fins.

This X frame is not secured directly to the hull members, but is rigidly braced by external wires between the fins and attached to the hull frames and girders by further external wires. This forms a semi-floating attachment.

The gas-bags are assembled on the axial girder and are fitted with automatic relief valves at the bottom connected to trunks which discharge the gas at the top.

It will be recalled that R 101 is fitted with a servo control

R 100.—The dining saloon and part of the surrounding balcony and staircase. The waitresses were formerly employed in building the ship.

gear consisting of a Vickers-Janney variable-speed gear and electric motors. A variable speed gear which gives every satisfaction on Naval guns seems rather out of place in an airship. R 100 is fitted with a system of elliptical gears and segments, also a ratchet control wheel with friction clutch, to obtain the same ease of control for a much lighter weight, and doubtless lower cost.

The ventilation of the hull is provided for by gauze windows. As the fabric is securely attached to circumferential wires which may be tightened, there is no need to keep the hull under internal pressure. This allows of the engine cars being much closer to the hull without causing the fabric to pant, and appears to be a considerable improvement on the system used on the Government ship.

The detail construction of this ship is unique. There are only 50 different interchangeable units, which are used in the whole structure, different combinations of these standard units forming all the component parts. This greatly simplifies construction, and facilitates repairs and replacements. A complete girder has been removed for examination, and new parts replaced without dismantling the remainder of the ship.

The girders are made with duralumin tubular booms. These tubes are somewhat similar to the tubes used on the Premier cycles of pre-motor-car days except that the duraluminium tubes are rivetted at the lap. Strip metal is fed into a special lathe which winds it into the tubular form. A few rivets locate the joint.

The tubes are then placed on a mandrel with a compressed air rivet-feeder. As the tube is passed along the mandrel a hole is drilled, pressure on a pedal allows air to feed a rivet into the hole, which is then closed. This operation is quickly repeated, and the tube rivetted up. By this machine rivets can be fed into place 10 ft. from the end of the tube. The operation is semi-automatic.

The girders are made up of these tubes with sheet-metal webs which are stamped out, and are interchangeable. These are attached to the end plates with gland nuts, which system allows a section in the middle of a girder to be removed without dismantling from one end.

Which of the two ships will prove the better, time alone can show. But R 100 has at least as good a chance as R 101 if it is given equal treatment.

AIRSHIP NOTES.

No Joy-riding in the R 101.

In the House of Commons on Nov. 27, in reply to Mr. Day, the Under-Secretary of State for Air said that no arrangements were being contemplated in which facilities would be offered to the public for a trip in the airship R.101 in any of its future trips.

Mr. W. J. Brown asked whether they might assume that facilities would be given to Members of Parliament and whether the trip on the previous Saturday might merely be regarded as an instalment like so much of our legislation.

Replying to Mr. Mander, Mr. Montague said that he did not think there was the slightest likelihood of the general public being invited to go on the first trial trip to Egypt.

Replying to Mr. Hardie, Mr. Montague said that no charge was made for the refreshments served on board the R 101 on Nov. 23. The lunch was an Air Ministry cost.

In a written reply to Mr. Mander on the same day the Under-Secretary of State for Air said that owing to the uncertainty of the weather the consideration of flights for M.P.s in the airships R 100 and R 101 had been postponed until the Spring.

The R 100.

The Capitalist ship R.100 is still in her shed at Howden although her sister ship has vacated the mast at Cardington and is safely inside her shed. There is so little clearance between the R 100 and the sides of the doors that specially good conditions are needed before the Capitalist ship can come out.

The R 101.

The Socialist airship R 101 was taken from the mast-head and put in her hangar on Nov. 30. This was done to make room at the mast-head for the R 100.

While in the shed the hull and engines will be examined. There is some talk of removing the servo-motor from the control system as it has been found unnecessary. The netting over the gas-bags is likely to be slackened,—which will increase the effective lift of each bag. This step was foreshadowed by Col. Richmond in his lecture to the R.Ae.S.

Airship Developments in the U.S.A.

The Times reports that the Pacific Zeppelin Transport Company has been incorporated in Delaware with the backing of the firms of Grayson, M. P. Murphy & Co., Lehman Brothers and W. A. Harriman & Company, bankers, and the Goodyear Zeppelin Corporation of America.

The Company proposes to develop a 36-hour airship service between the chief cities of California and Hawaii, which will be extended to the Philippines and Japan.

The Goodyear Zeppelin Company is ready to begin the construction of two airships for the Pacific service as soon as the two it is now constructing for the Navy have been completed. [Which will presumably take at least two years.—ED.]

THE LIGHT AEROPLANE
AND THE FLYING CLUBS.

ANOTHER RACING MOTH.

In the Australian East-to-West race from Sydney to Perth hich was held from Sept. 30 to Oct. 5, the De Havilland rcraft Proprietary Ltd. entered a special Gipsy Moth hich was flown by Major Hereward de Havilland, D.S.O., e Managing Director.

This special Moth, VH-UIQ, was flown as a single-seater ith a covered front cockpit and had fairing behind the ilot's head, a racing undercarriage and wheels, petrol tank n the fuselage, and a streamlined centre-section, and had everal other little refinements to give an extra bit of speed. he engine was fitted with special racing heads, carburetter nd induction pipe but was otherwise quite standard.

This machine made the fastest time in the race, averag-ng over 107.8 m.p.h. for the 2,450 miles. No trouble of any ind was experienced with the engine, which was run, for he whole course, at speeds varying from 2,300 to 2,400 r.p.m. The petrol consumption of 5.8 gallons per hour was actu-ally slightly less than that given by the other standard Gipsy engines in the race.

Twelve of the sixteen other competitors in the race flew H. aircraft of which nine were perfectly standard Gipsy ths, and of these, five were flown by club-trained amateur vate-owners.

No single case of mechanical trouble was experienced with these standard engines although they were all run at full throttle (2,100 r.p.m.) the whole way from Sydney to Perth at altitudes below 500 ft. and very often at 5 feet in the heat of the Nullabor Plain.

The winner of the race on handicap was Mr. H. C. Miller flying an old D.H.9 with Major de Havilland on the special Moth second, and Mr. Cunningham, a private owner of a Gipsy-Moth, third. Mr. Cunningham is a "squatter" by profession, and uses his Moth to fly over his paddocks and "count his sheep." Gipsy-Moths also took fourth and fifth places. On speed alone Major de Havilland was first, with Mr. Heath on Sir Alan Cobham's old D.H.50, now fitted with a Nimbus engine, second, and Mr. H. C. Miller third.

THE SPEED WINNER.—Major Hereward de Havilland.

A RACING MOTH.—Major Hereward de Havilland on the way from Melbourne to the start at Sdyney, with a passenger on board.

FRESH AIR.—Members of the Bournemouth Young Airmen's League being introduced at Hamble.

BRISTOL ACTIVITY.

Lord Apsley was the first member of the Bristol and Wessex Aeroplane Club to pass his "A" licence tests in the new Air Ministry year, on Nov. 2. The club now has 62 licensed Pilot Members.

At the end of December the club will have to move to the Bristol Air Port. For a short time members may have to camp in the hangar, as the new Club House, though nearly finished, will not have much chance of drying. Enough of the Aerodrome will be ready for club flying.

The Official Opening, for which an important Pageant is being organised, will be on May 31, 1930. This is a date which all good aviators should make a note of. Bristol does things well.

Major Cooper vacates his appointment as Secretary on Feb. 1 next. He will be greatly missed. His courtesy and consideration have won him many friends. And, from this paper's view, he has been one of the best of Secretaries, in sending club notes punctually and concisely.—C. G. G.

HAMPSHIRE ACTIVITY.

With 114 hours 35 mins. flying time for November, the Hampshire Aeroplane Club have passed the total time for last year and have so far completed 1,603 hours. Flying has been almost entirely on two Moths, JR and OH, as the Avian and Spartan were out of commission till the last day of the month.

During these eleven months 35 *ab initio* pupils have taken "A" Licences, and, at the moment, despite the fact that it is now December, approximately 80 members are being instructed.

Eleven new flying members joined the Club during the month, Lts. Rimington and Spencer, R.N., and Messrs. Sanders and Ashby did first solos and Surgeon Comdr. Woodhouse and Mr. Gairdner passed for their "A" Licences. All of which reflects great credit on Mr. W. H. Dudley, the instructor, and on Messrs. Lenny and Riches, the engineers.

The Club will be closed for the Christmas holidays from Monday, the 23rd, to Friday, the 27th of December.

THE BEAGLE MEET AT SYWELL.

The Beagle Meet on Nov. 30 at Sywell, the aerodrome of the Northamptonshire Club, was a great success. A number of people arrived by air, including the Director of Civil Aviation, Sir Sefton Brancker. In all about 20 machines were at the Meet.

Some disappointment was caused by the non-appearance of Mr. Malcolm of the De Havilland company, who was expected to make the most of such an exercising occasion. The disappointment was intensified by the fact that Mr. Linnell had specially flown to Stag Lane to measure Mr. Malcolm for a beagling suit of the type shown in the accompanying illustration. [Perhaps a porbeagle would be more in Mr. Malcolm's line.—ED.]

N.F.S. NOTES.

The Berks., Bucks. and Oxon Aero Club at Woodley, Reading, has now got its second aeroplane, a slotted Moth (Cirrus III). 26 members are now learning to fly under Mr. G. A. Pennington, the club's chief instructor.

Miss Shillington has become the first private owner at Woodley, and has bought a Coupé Moth with slots.

BEAGLING AT SYWELL.—The Northampton Aeroplane Club meets hounds.

Private lock-up hangars are being built near the clubhouse. The charge for these is £3 15s. per month and complete maintenance service is provided from £1 a week. Rapid headway is being made with the club buildings, which are being provided by National Flying Services. The main hangar is practically complete and the clubhouse will probably be ready early in the New Year.

Intending members should apply to Miss L. Cribb, the Hon. Secretary, at 12, Highmoor Road, Caversham, Reading, or to Mr. Pennington, National Flying Services Ltd., Woodley Aerodrome, Reading. A limited number of members are being enrolled at the following rates: Flying member, 3 gns. entrance fee and 3 gns. annual subscription; non-flying members, 1 gn. in each case. Members joining now pay subscriptions for 1930,—as membership begins from the date of election.

THE OXFORD ACCIDENT.

The Berks, Bucks and Oxon Aero Club of the Reading Aerodrome are grieved by repeated inquiries about a crash at Oxford some weeks ago in which the machine, a Moth, G-AARM, was wrecked and later burnt. The pilot, Mr. Skuce, of Oxford, was seriously injured, and his passenger, Mr. Buckle, had a remarkable escape. The Committee state that although Mr. Skuce and Mr. Buckle are members of the club, they were not flying a club machine but one believed to be the property of Phillips and Powis Aircraft Ltd., with whom the club (which is a branch of N.F.S. Ltd.) have no connection. Mr. Skuce's condition is improving, but he is not yet able to leave the hospital.

(Communicated by the B. B. and O. Aero Club.)

THE READING AERODROME.

There seems to be a certain amount of misunderstanding as to the ownership of the aerodrome at Reading.

This aerodrome which, just outside Reading, is used by the Berkshire and Buckinghamshire Aeroplane Club and that Club is a Branch of the National Flying Services Ltd Consequently the idea seems to have got around that the whole of the Reading aerodrome belongs to N.F.S.

The position actually is that Phillips and Powis Aircraft (Reading) Ltd. are the actual owners of the freehold of the aerodrome. An acre and a half of it has been let to N.F.S. to put up a shed for their own machines. Also N.F.S. have flying rights on the aerodrome. Apart from that they are definitely tenants of Phillips and Powis, who are not connected in any other way with N.F.S.

(Communicated by Phillips and Powis Aircraft (Reading) Ltd.)

AT THE BERKS, BUCKS AND OXON AEROPLANE CLUB (The Reading Branch of National Flying Services Ltd.).—Left to right: Mr. G. A. Pennington, Instructor; Miss Louie Cribb (commonly known as Toby), Honorary Secretary; and Mr. W. Richardson, a member who is to be congratulated on learning to fly in six days.

THE CANADIAN FLYING CLUB.

Twenty-two Flying Clubs have been actively flying in Canada this Summer.

The Victoria Flying Club have been unable to continue since the Spring owing to the crash of their aircraft.

All Clubs show an increase in membership, the total of which now stands at 4,840. Calgary leads with 1,060, Saskatoon has 603 members and Regina 339.

The operations of the Clubs during the nine months ending Sept. 30 are as follows:—

THE AUCKLAND AERO CLUB.

The Auckland Aero Club began operations at the end of last February, and up to the middle of October had put through 14 "A" licence pilots with only one instructor. A second instructor has been engaged and he is doing an instruction course with the Defence Department before taking up his position.

In October the Club organised what is known as an Art Union (corrupting lotteries are prohibited in New Zealand with the sanction of the New Zealand Government. The exact workings of this Art Union are unknown, but apparently the Club hopes to benefit to the extent of about £2,000, with which it intends to provide for an aerodrome of its own, plant, equipment, etc.

In connection with the Art Union the Club organised a tour of the whole of the North Island with three Gipsy-Moths,—two belonging to the Club, piloted by Major G. A. C. Cowper and Mr. W. S. R. Bloomfield, and one privately owned by Mr. J. C. Horton. The reason for the flight was, theoretically, to develop, or at least to direct the attention of local bodies to establishing, municipal air-parks.

The route followed was by way of Auckland, New Plymouth, Wanganui, Wellington, Martinborough, Masterton, Hastings, Gisborne and back to Auckland, with many stops in between these places. At each stop the machines were met by the Mayor, Councillors, officers of the Chamber of Commerce and the local Aero Club Committee, and the crews gave short addresses on the need of landing-grounds.

Enthusiasm was aroused at each stop and a considerable amount of publicity was obtained in the local press. The organisers foresaw the value of the journalistic co-operation, with the result that certain members of the Tour were directly connected with the New Zealand Press.

Mr. Horton, a partner of Horton and Wilson, the owners of *The New Zealand Herald*, flew his own machine, and Mr. K. R. Hacket, Major Cowper's passenger, is the son of the editor of the same paper.

A CASE OF RABIES.

Some kind of rabies bug must have nibbled the aeroplane of Mr. Roy Tuckett, if the newspapers are to be believed. Mr. Roy Tuckett was hurrying to reach the Cape in record time, but apparently his mount grew restive at being hurried through the tropics.

At Alexandria, owing to some trouble with the throttle control, the machine, when the engine was started, rushed across the aerodrome, rudely pushing its owner and mechanics out of the way until it could bite the hangar, which is now understood to be receiving Pasteur treatment.

FLYING CLUB EQUIPMENT.

Here is the quickest description on record of the equipment of a Canadian Flying Club, which must be nameless, as seen by a visitor:—

They were in the unfortunate position of having had their only Moth visited violently by a wandering prop from an OX5 Waco. There were holes in both wings, and the fuselage. Their two OX Eaglerocks were whole and sound but not working very hard.

COMMERCIAL AERONAUTICS.

A NEW CATEGORY FOR PILOTS.

A correspondent of THE AEROPLANE raises a point which ms to deserve the serious consideration of the authorities charge of Civil Aviation. It is also one which might be cussed by the Guild of Air Pilots and Navigators. The estion simply is whether a third, or rather a fourth, kind Air Pilot's licence is required.

At present we have the "A" licence which entitles a ot to fly by himself or to take up some trusting friend d merely guarantees that he is fairly competent not to eak his own neck or that of his passenger.

Then we have the "B" licence which is more or less a arantee that the pilot is a thoroughly trained and comtent person, thoroughly fit in body and mind, who can trusted with the lives of any number of passengers.

As a matter of fact the qualifications for a "B" licence e not nearly high enough. A mere matter of 200 hours in light aeroplane ought not to entitle a pilot to ply for hire reward. No man, still less a woman, can gain enough exrience in the time.

On top of that we have the Master Mariner's licence or ther the Master Air Pilot's licence, which guarantees a an as a navigator as well as an aerial chauffeur.

Now this correspondent suggests that we need yet another cence between A and B licences which will allow a pilot fly for hire or reward carrying freight or testing aeroanes but not carrying passengers.

This strikes one as quite a reasonable proposition. There re a fair number of pilots in this country who cannot get B licence although they are quite good pilots. There are en with slightly defective eyesight, or other defects which re not likely to cause any trouble, but because of them the edical authorities would never stake their reputation on e ability or rather the infallibility of those pilots.

There is, for example, the case of the pilot with one eye, f whom one wrote a week or two ago. He is quite as good pilot as any in this country, but quite understandably the edical authorities are afraid that if he did have an accient with passengers and killed some of them, they might e asked, or rather a question might be asked in Parliament, hy he was allowed to carry passengers when he only had ne eye. The fact of his only having one eye might have othing to do with the crash. But anything is good enough or captious Members of Parliament to hang a question on.

Such pilots, many of them with a great deal of ability and xcellent brains, might very well be allowed to fly for hire r reward just so long as human lives were not entrusted o them. The judge of their ability and the deciding uthority as to whether they got work to do or not would n fact be the Insurance people. If the Insurance Companies were not satisfied about their ability as pilots then hey would not insure either them or their cargo and obviously such pilots would not find employment.

The correspondent who makes this suggestion also introduces another factor which is quite a good argument in favour of this third-class, or rather second-class licence. Under the present regulations a man can only get a "B" licence if he has flown for 200 hours. He must not only be physically fit and able to pass fairly searching tests of his ability as a pilot, but he must also have a certain amount of experience. Our correspondent suggests that the intermediate licence might be granted a pilot who has passed the medical test and the flying test but has not had enough experience to justify being given the Class B licence.

He makes the interesting suggestion that if this new licence could be introduced it would be the means of creating new business and also of providing some part-time piloting for those already employed in other branches of flying. For example when there is a rush of work during the busy season and all regular pilots are otherwise engaged, such intermediate pilots might very well be used in ferry aeroplanes for the newspaper people to fetch photographs, films and so forth from the scene of what the newspaper people regard as events of immediate public interest. And when all passenger-machines are as full as they can hold of passengers such pilots might be put on to pilot freight machines.

There is undoubtedly considerable scope for a more general use of aircraft for various purposes. The present requirements for a B licence, which is necessary for all flying other than that of a private owner himself, are not severe enough, and yet they enforce an unnecessary handicap on many who might take up aviation and find new scenes for activity. Such part time pilots, or inexperienced pilots, would in time thus have a chance which they do not have at present of putting in the full number of flying hours necessary to qualify for a passenger-carrying licence as it should be.—

C. G. G.

THE LOSS OF THE "CITY OF ROME."

In the House of Commons on Nov. 27, in reply to Mr. Lees, the Under-Secretary of State for Air said that the Air Ministry had no information that defects had been reported in the seaplane *City of Rome* prior to the loss of this aircraft off Spezia. The Air Ministry's regulations required a public transport aircraft to be inspected by a licensed ground engineer and certified as safe before each day's flight and he was informed that this requirement had been fulfilled in the present case. There was every presumption that this aircraft was in proper flying condition before it started on its journey but the Secretary of State for Air would wish to await the conclusion of the investigation which the Italian authorities were making in case anything should emerge on this point.

NOW WE'LL TELL ONE.

According to the New York correspondent of *The Times* The General Development Co. of Connecticut announces that it is going to build four aeroplanes bigger than any others in the World. According to the prospectus they will be of the "flying wing" type with a span of 262 ft., a height of 31 ft., a length of 138 ft., and a weight of 72½ tons. Each is to have eight 1,000 h.p. engines. The aeroplanes are designed to carry 160 passengers and a crew of 17, but the maximum capacity is alleged to be 206 people. There is the usual flowery stuff about dining-rooms and spacious lounges and kitchens and lifts and so forth. The prospectus further states that these machines are to be finished before the end of 1930 and that the four together are expected to cost £400,000.

All this sounds very beautiful till one learns that the moving spirit in this scheme is Dr. William Whitney Christmas, "who is said to have been the inventor of the aileron balancing system used on all aeroplanes."

We have heard of Dr. Christmas before. He invented a wonderful high-speed aeroplane which was going to lick creation, and all that happened was that his wings came off soon after it left the ground and killed a very good American pilot. Dr. Christmas has been connected with so many wonderful schemes which have not come up to expectations that one is not filled with faith in the success of this scheme.

Apart from which, even in America four machines of that type could hardly be built before the end of 1930, and one is pretty sure that four such machines could not be built for £100,000 apiece.

The report states that the chief engineer is Mr. Elliot Green, formerly an aeronautical engineer with the United States Department of Commerce, and a well-known aeroplane designer. He may be all that, but one cannot remember him as having designed any well-known aeroplane, so even his name does not lend an air of artistic verisimilitude to the story.

A LOW-PRICE FREIGHT SERVICE.

There is some talk of a freight service between Hull and London. This service will be operated by National Flying Services between the new municipal aerodrome at Hull and Hanworth. The idea is to carry small parcels at the rate of 1d. per 10 lbs. per mile.

ANOTHER CATERPILLAR.

Mr. C. R. L. Shaw (Flg. Off. R.A.O.F.) escaped with a parachute when an experimental aeroplane of the Bristol Aeroplane Co. got out of control over Filton Aerodrome on November 29.

Mr. Shaw got out at over 1,000 ft. and alighted uninjured.

Apropos of this event, the following is taken from the Bristol *Evening World*—a Harmsworth publication, as might be imagined:—

QUICK WORK.—Our £5 prize for a news item has seldom been so well earned as by Mrs. Winchester, of South Rocks-terrace, Winterbourne, who telephoned *The Evening World* last evening immediately she saw Mr. C. R. L. Shaw's aeroplane falling to the ground.

Through her promptness, *The Evening World* was able to print the account of the crash, and of the pilot's fortunate escape in his parachute, in an exclusive story before any other newspaper, while a later edition included the full story from the pilot of how the accident occurred.

Mrs. Winchester was breathlessly telling the story to a reporter at head office. "Is the pilot safe?" asked the reporter.

"I don't know yet," said Mrs. Winchester. "He's still in the air in his parachute."

Thus *The Evening World* was able to have a reporter and a photographer on the way to the scene of the crash a few seconds after Mr. Shaw had come to earth.

Thus efficiently does our Press encourage practical airmindedness in our proletariate.—C. G. G.

Corresponding week, 1920:
Machines, 22; Passengers, 33; Crews, 28; Total personnel, 61.

CROYDON NOTES.

The rain it raineth upon the Just and upon the Unjust in the Main Hall at Croydon Aerodrome, but particularly upon Corko Lino. It does not behave like decent open-air rain, but, collecting stealthily on the roof, it not only becomes impregnated with whitish calcareous matter, but descends suddenly, a month's rainfall at a time. Recently, Corko Lino, sitting behind the bars at the receipt of Custom, suddenly received a douche of this nature, which would infallibly have drowned him if his stream-lined bowler hat brim had not carried off the worst of the flood like a gutter. Chalky alluvial deposits caused Corko to resemble the furred interior of a kettle, but otherwise he was little the worse.

He now operates under an umbrella, standing on some two hundred sheets of blotting paper and daily sends up a muezzin of praise that his rental is so small in comparison with the advantages he enjoys.

A direct answer to prayer is occasionally recorded, but a direct answer to a petition to the Air Ministry is a rarer occurrence.

One has pleasure in announcing, therefore, that the request of the Traffic Officers here for bathing facilities in the quarters allotted to the night-duty officer in the Control Tower, has been suddenly and unexpectedly complied with. They asked for a shower bath or failing that a hip bath. They got both, for the water came through the ceiling and collected about hip high on the floor.

Outside things are not so bad, though the tarmac now borders a promising lake, from which emerge newts, tadpoles and other amphibians, whilst, Organ P. Golley is to be seen about in sea-going spats of inflatable para rubber and an Auliffe lifebelt ready blown up.

Works, and one believes Buildings as well, have dug an enormous well near the Terminal Block which is said to be a soakaway. But unfortunately, they seem to have struck a spring of a highly active nature at the bottom of it.

Persevering persons with buckets on bits of string, have so far kept the soakaway from overflowing and flooding the neighbourhood, but having nowhere to put the water they are completely baffled. It is thought another well will have to be dug to accommodate it.

Last week, one accused Walt. Rogers, Ven Appleby (Master Skoplye), Ernie Parker (Master Uskub), old Uncle Bill Lawford and all, of having caused a W.10 to go to Athens.

In this case it was not a W.10, but an Argosy, and our apologies are herewith tendered to all concerned.

On this flight, the two engineers, Messrs. Parker and Appleby, put up a wonderful show, sacrificing very many hours' sleep and scarcely seeing anything of the towns they passed through, in order to attend to their engines.

Engineers on long-distance flights can make or mar an enterprise, and in this case they certainly made it and made it highly successful too.

Both Imperial and K.L.M. pilots speak with the greatest admiration and respect of the flight engineers who have accompanied them on their long-distance flights, where such energy, initiative and real hard work are absolutely essential qualities in an engineer.

The following K.L.M. regularity figures for October may be of interest:

Amsterdam—London	100%.
London—Amsterdam	100%.
Amsterdam—Paris	97%.
Paris—Amsterdam	100%.

Amsterdam—Paris, unfortunately, had one failure for bad weather, so the month's total is only 99.2%.

All sunburned men are slightly handsome, and it is strange to see all sorts of brick-red people turn up here in November from places like Athens and so on.

Some confusion exists in the minds of some of us whether a certain brick-red hero who recently returned from foreign parts had been on leave doing a golfing tour of Europe, or merely doing a job of work on the Indian Air Mail route.—SPRY.

WHAT TO AVOID.

A Notice to Airmen has recently been issued, reading as follows:—

"SEALAND AERODROME:—Slag is being spread over Sealand Aerodrome. Care should be exercised in landing and horses and carts should be avoided."

Our morbid correspondent Spry has received a letter which is published below, as it may be of interest to pilots contemplating the sort of flying the Air Ministry appears to be worried about:—

Dear Sir,—Your excellent advice to aeronauts to avoid horses and carts when landing and stick to aeroplanes for that purpose calls to mind the oft repeated dictum of my Uncle Solquhoun (pronounced Swoon) who, even in his cups would loudly aver that the horse and cart were never meant to fly with, and were unsuitable for perfect three point landings, owing to the horse having four legs and the vehicle two wheels.

My Uncle was not inexperienced in such matters and over the second bottle he used often to relate an experience he had in 1881 which as it bears out your advice to modern pilots, I beg leave to repeat here.

Uncle had driven our pony phæton to the village to buy Aunt Jobiska a bag of self-raising flour as a birthday gift.

On the return journey, whilst passing Popwell, Fizzle and Funes' pyrotechnic store, that emporium quite suddenly blew up, carrying my Uncle, pony phæton and all with it.

Uncle was seriously put out at the time, for the date was November the 5th, and that Mr. Fizzle was always such a one for a bit of skylarking, but it turned out afterwards that my Uncle was mistaken for nothing was ever found of Mr. Fizzle but a portion of his left whisker and a doubtful incisor.

However, there was poor Uncle travelling with great speed at a thousand feet, keeping the pony's nose into wind with the utmost difficulty and not at all sure our phæton was airworthy, as it was quite an old one.

Magnificent whip though my Uncle was, the task was beyond him. A piece of flying wreckage, believed to be the crown of Mr. Popwell's beaver hat, struck Uncle on the ear, rendering him partially unconscious.

The phæton became inherently unstable and my Uncle had just time to open his gig umbrella and leap for life, before the pony (named Topsy) got into a spin.

What with the umbrella and the bag of self-raising flour which he had in his ulster pocket, my Uncle came down comparatively lightly in the yard of the "Rubber Necked Swan," where, after swallowing a gill of gin, slight concussion, shock and loss of memory supervened, and my Uncle flatly refused to pay for the refreshment and gave quite a lot of trouble.

I do hope, Sir, the dreadful example of my Uncle Solquhoun will be heeded by rash young aviators, as it would be such a pity if broken limbs resulted, for there are few men like my Uncle to-day, and not many ponies as quiet to ride, drive or fly, as our poor Topsy.

I am, Sir,
Your obedient servant,
(Signed) PETRONELLA PRAUGHAN (pronounced Prawn)

FREIGHT TRANSPORT BY AIR AND RAIL.

Arrangements have been made between Imperial Airways and the railway companies for a combined rail and air goods service. Freight may be sent to the Continent from over 100 provincial towns. The goods will travel by train to Croydon whence they will be flown to the Continent. [Where they will doubtless be mis-handled by the French railways for months.—though in Germany and Switzerland and Holland they will be handled efficiently.—ED.]

THE INDIAN AIR MAIL.

The Indian air mail is temporarily being flown across Europe owing to the various calamities that overtook the Calcuttas. On Saturday the machine flying down from Cologne to Nuremberg was unable to find Frankfort in the fog and landed in a swampy field. The undercarriage was damaged and the machine suffered other injuries.

AIR TRANSPORT OVER POLAND.

On Sept. 23 new regulations came in force in Poland concerning the entry into and passing over Poland by foreign aircraft. In pursuance of these regulations every aircraft proceeding to Poland or passing over its territory should be provided with a certificate containing necessary particulars of the aircraft, its crew, passengers and cargo.—The Polish Consular representatives abroad are authorised to issue such certificates.

The aircraft of countries which have acceded to the International Air Convention of 1919, or aircraft of countries which have concluded air agreements with Poland will receive the said certificates immediately and free of charge. An exception includes military aircraft or other State aircraft, whose entry into Poland or passing over its territory is to be settled by way of diplomacy.

Commercial transport of passengers and cargo by aircraft requires in Poland a special licence from the competent authorities.

Regarding the entry of Poland or passing over Poland of private aircraft of other countries, the persons concerned should apply to the Polish Consular representatives abroad who will in each case communicate with the competent Polish authorities.

AGENCIES WANTED.

A firm of good repute in Portugal wants agencies in that country for British firms. At the present moment the firm is not in a position to place definite contracts for deliveries, but it would like to communicate with British firms with a view to possible business on commission in anything from complete aircraft and aero-engines down to accessories and raw materials. Letters addressed L. H., c/o THE AEROPLANE, will be forwarded.

SIMPLIFIED LUBRICATION.—The Adcol Movable Oil Pump.

A USEFUL ACCESSORY.

The well-known firm of Alexander Duckham & Co. Ltd. have produced a very useful servicing outfit.

This consists of a small chassis on which are mounted two ten-gallon drums and two delivery pumps of one quart capacity each.

The drums carry two grades of Adcol, N.P.5 Aero Oil, and also a Castor Grade, Adcol A.E.R., the former being to Air Ministry Specification D.T.D.—109.

This small outfit enables oil to be delivered direct to the sump of the machine and thereby avoids the possibility of dirt entering the engine. It also does away with a lot of worry and mess.

We understand that these outfits are being offered to Aircraft Operators and Clubs on very favourable terms.

THESE COLD TIMES.

Now that the cold weather is coming on and cautious people empty their radiators at nights a good many readers of THE AEROPLANE may like to have one of the Radiator Warning cards issued by Alexander Duckham and Co., of 6, Broad Street Place, E.C.2.

On the card, which has a string to be hung over the radiator cap, is the word "Warning" in red in big letters and below, also in big black letters, the words "Radiator Empty." In the middle is an inoffensive Duckham trade-mark which deserves to be there if only as an acknowledgement of the firm's thoughtfulness in issuing such cards as a warning to garage hands not to go starting up the engine,—and incidentally as a reminder to the owner himself that he has emptied the radiator.

Any reader of THE AEROPLANE can have these cards for nothing by writing for them and mentioning THE AEROPLANE.

A FIT NOT TO BE FORGOTTEN.

Although the motto of the K.L.G. people is "Fit and Forget," users of internal combustion engines of all sorts ought not to forget that there is always a K.L.G. fit for their particular engines. Consequently the very neat list recently issued by the K.L.G. people ought to be in the hands of all motor users. A copy of it can be had gratis and post free by writing to K.L.G. Sparking Plugs Ltd., Robinhood Engineering Works, Putney Vale, London, S.W.15, and mentioning THE AEROPLANE.

NEW COMPANIES.

NAVARRO SAFETY AIRCRAFT LTD.—Private company. Registered Nov. 14. Capital, £4,000 in 25,000 "A" shares of 2s. each and 30,000 "B" shares of 1s. each. Objects: To carry on the business of manufacturers of and dealers in aerial conveyances and aircraft of all kinds, and the component parts thereof, etc. The provisional directors are: R. Shelton, 49, Dudley Road, Ilford, costs accountant. F. W. Cheeseman, 29, Lincoln Road, South Norwood, S.E.25, shorthand clerk. Remuneration: 5% of the net profits in any year. Solicitors: Scott, Bell and Co., 15, Queen Street, Cheapside, E.C. Registered office: Finsbury House, Blomfield Street, E.C.2.

PERSONAL NOTICES.

MARRIAGE.

MYLNE—ADAM.—On Nov. 9, at St. Peter's, Eaton Square, by the Rev. Austin Thomson, Sq. Ldr. Athol W. Mylne to Eleanora Constance Adam.

FORTHCOMING MARRIAGES.

DON—BIRKBECK.—A marriage has been arranged, and will shortly take place, between Wing Cdr. Francis P. Don, No. 502 (Ulster) Squadron, R.A.F., Aldergrove, Co. Antrim, third son of the late Robert B. Don, of The Lodge, Broughty Ferry, and Angela Jane Birkbeck, only daughter of the late Edward L. Birkbeck and of Mrs. Edward Birkbeck, Elmham House, Norfolk.

LANDON—WARREN.—The engagement is announced between Group Capt. J. H. A. Landon, D.S.O., O.B.E., R.A.F., only son of Mr. and Mrs. Frank Landon, of Brentwood, Essex, and Biddy, younger daughter of Col. Pennefather Warren, C.B.E., Chief Constable of Buckinghamshire, and Mrs. Pennefather Warren, of Wing Lodge, Leighton Buzzard.

ORR—BIRMINGHAM.—A marriage has been arranged, and will shortly take place, between Lionel Frank Hastings Orr, R.A.F., only son of Lionel Fitzgerald and the late Mrs. Orr, 2, Grove Avenue, Blackrock, Co. Dublin, and Sheelagh, younger daughter of the Rev. Robert and Mrs. Birmingham, 22, Belgrave Road, Monkstown, Co. Dublin.

BIRTH.

DEACON.—On Nov. 18, at Ambala, India, to Moira, wife of Capt. H. W. Deacon, R.F.C., R.A.—a daughter.

PRACTICAL FLYING.

CINQUE PORTS flying club (Subsidised). **WINTER RATES** commence Oct. 1. 6 months' sub. 31s. 6d. Entrance fee 21s. Monthly sub. 21s. No entrance fee. Seven of our members took "A" licences in 4 weeks ending Sept. 26. Under 2 hours by car from London. Enlarged Club Room and Bar. Send 6d. to Hon. Sec., Hythe, Kent, for illustrated brochure. "LEARN AT LYMPNE."

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rate 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn on latest types of Gipsy Moth, Hermes, Avian, and Gipsy Bluebird light aeroplanes. Chief Instructor, Captain V. H. Baker, M.C., A.F.C., Airwork Limited, Heston Air Park, Hayes 410.

Learn to Fly at the Midland Aero Club. Four training machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

National Flying Services Ltd. Tel., Ger. 9316. Join N.F.S. Learn to fly. Fly when you wish.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors. Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum of time. Special offer, trial lesson 12s. 6d. Reading Aerodrome. Sonning 114.

SITUATIONS VACANT.

Aircraft Draughtsmen required immediately. Write, stating age, experience and salary required, to Handley Page Ltd., Cricklewood, N.W.2.

Assistant required by Prominent Aircraft Firm to deal with their Apprentice Training. Works Library, Engineering Society and similar semi-technical duties. Applicant must have secretarial experience and good educational and practical training. Reply stating experience and salary required to Westland Aircraft Works, Yeovil.

Wanted, Six Good Engine Installation Fitters immediately. A. V. Roe and Co. Ltd., Manchester.

SITUATION WANTED.

Public School Boy seeks progressive position abroad where aircraft communications are being developed, preferably in Colonies. Keen, Pilot's "A" Licence, slight business experience. Box No. 5741, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

We offer sound Instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A, B, C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

AEROPLANE PHOTOGRAPHS.

Copies of Aeroplane Photographs (indicated as such in the inscriptions under the pictures) may be had from:—THE AEROPLANE Office, 175, Piccadilly, London, W.1. Single prints, 6 in. × 8 in. cost 2s. 6d. each, and 1s. 6d. for each number of the same print. Larger sizes or larger quantities may be had at special prices.

ON VARIOUS THINGS.—III.

(*Continued from p.* 1224.)

Mail Work.

Some day, no doubt, one of these powerful financial groups, which we have referred, will awake to the fact that if ey can only make suitable contracts with our Post Office ey will find running Air Mail lines a very paying proposi-n. Compared with an aeroplane designed for carrying number of passengers, a pure mail-carrying aeroplane is nparatively cheap.

If a great financial group, with a few millions of pounds its disposal whenever it wants them, comes along to the st Office, and proposes to run an Air Mail line to the Cape to South America, the Post Office cannot very well use to do a deal with them, no matter how much the overnment may feel itself committed to giving Imperial rways Ltd. first choice on any existing Air Mail route, nply by virtue of the fact that Imperial Airways is sub-lised by the Government and the Government expects get something for its money out of that particular firm efore it enters into an alliance with any other firm, even ough it is not asked to put up a subsidy for such a firm. nd so we may expect to see developments in this direction. Apart from this no great imagination is needed to fore-e that some day somebody will produce a passenger-rrying aeroplane, or at any rate an aeroplane which carries assengers and freight, which can do either or both at a ofit.

When somebody produces such an aeroplane they may nd that there is money to be made by running in direct ompetition from our London Terminal Aerodrome to the ontinent or to Africa, or for the matter of that to India nd Australia, along the routes which have already been repared in any of those directions, with their own com-ercial aeroplanes,—somewhat in the way in which the irate 'buses have tried to run alongside the London eneral Omnibus Co.'s cars on the public roads,—but with etter prospects of success.

Future Policy.

This, then, is the really interesting side of aviation which s likely to develop in the course of the next few years. nd, obviously, if The Aeroplane is to publish information bout what is being done in commercial aviation all over he world, as is its duty, it cannot spare room for the minor affairs of aviation—such as Clubs, or individual flights, —whether for self-advertisement or not.

Be it remembered that when we are dealing with Commercial Aviation in this paper, we are not dealing merely with whatever the British Aircraft Industry may turn out in the way of commercial aeroplanes, or with what British aircraft operating firms are doing with whatever aeroplanes they happen to have. If we are to do our best for the progress of British aviation we have to tell in this paper what is being done by the great Aircraft Operating Firms all over the world. And we have to describe the types of aeroplanes which they use, and the types of engines they use, and we have to publish all we can learn about how all foreign competitors achieve the results which enable them to get ahead of us when they do so, or at any rate we have to describe everything they do which may conceivably show some progress over us.

As a matter of fact, already there is so much doing in other parts of the world in commercial aviation that a paper the size of The Aeroplane could be filled perfectly easily every week with information about the technical developments and commercial developments of aircraft operators in other countries.

All this does not in the least mean that one has not the highest esteem for all the good people who have done good work in promoting the club movement. Compared with the way in which certain club pilots and certain ground engineers of flying clubs have carried on during the last two years with inadequate equipment, and without the wholehearted support which they should have had from the members of the club, and sometimes the Committees, the Children of Israel in Egypt had a comparatively soft job in making bricks without straw.

In fact, one's greatest regret about all the information ever been published in this paper about the Club movement is that those who have sent the Club notes have never given full credit to the pilots and the ground engineers by describing adequately how they achieved the excellent results which they have achieved.

Therefore, if and when anybody in any Club does come across any good ideas either for the betterment of aeroplanes or engines, or training, we, of the staff of The Aeroplane newspaper, will be very glad to hear about those ideas

"TRADE WHICH, LIKE BLOOD, SHOULD CIRCULARLY FLOW."—*(Dryden.)*

ENTERPRISE OVERSEAS.—An Avro Avian (Genet) in a shop-window in Singapore.

Digitized by Google

and to give full credit to the particular individual who happens to be responsible for them. Also, if any individual who does deserve such credit and has such ideas, is too modest to rush into print himself about them, we shall be very pleased to have description of those ideas and to publish them without mention of the name of the modest person who is responsible for them.

So far from wishing any ill to the clubs, one hopes most sincerely that they will all continue to be great successes, whether as individual clubs or as members of the network of allied clubs which is being formed by National Flying Services Ltd.

PROPRIETARY SCHOOLS.

This point, incidentally, opens up another aspect of the case. Those Clubs which have been taken over by National Flying Services Ltd. (and more are likely to be taken over by that organisation) have practically become proprietary clubs and have ceased to be co-operative clubs. They will have ceased to draw the Government subsidy, but they will, on the other hand, have the advantage of a central organisation which can supply them with aircraft and all the material for the maintenance and repair of aircraft at a lower price than that at which they could buy such equipment as individual clubs. In fact, those clubs will then be in the same position as the various proprietary flying schools which have existed ever since flying first began and have still done fine work in training pilots since the club movement began some five or six years ago

Of course, club members and club committees will be frightfully annoyed with one for daring to suggest such a thing, but there are fairly good reasons to believe that pilots who are being trained, or who have been trained, at proprietary schools do in fact get a better kind of training than those who have been trained in club schools.

One does not for a moment suggest that the club instructors are any less efficient than are the instructors in proprietary schools. What it all means really is that under the driving force of commercial necessity the proprietary schools have to be more highly efficient or else shut down, because they are not drawing a Government subsidy. Also the individual proprietor of the school, if he be competent to look after his business, is bound to be more efficient than the busiest committee you can imagine.

A MINOR FALLACY.

Mr. Goodfellow makes the point that a great many club-trained pupils have become private owners. The inference is naturally that if they had not learned to fly at a club they would not have bought aeroplanes and that our Aircraft Manufacturers would have been poorer in consequence. This one believes to be a fallacious argument.

Admittedly the Clubs have popularised aviation to quite a considerable extent. But, the type of man or woman who can afford to buy a private aeroplane would sooner or later have become enthusiastic about flying even if clubs had not existed. He or she would have learned fly at one of the flying schools, and in due course, ha qualified as a pilot, would have bought his or her o aeroplane.

As one of those who supported the club movement m enthusiastically when it was first started one may perh say now that about the worst thing that ever happened the clubs was the institution of the Government subsidy

If the clubs had had to work or starve there would h been a lot more enthusiasm in them than there is present. There would have been more members worki in the sheds on the machines, helping the ground eng neers, and probably there would have been less opportu of lounging about in armchairs in those very comforta club premises which now exist, largely thanks to the subsidy

BIG MONEY.

All this discussion of Big Money interests, and commer cial prospects, and Government subsidies,—or doles, whi are the same thing—leads naturally to a letter from Sir Aliott Roe, who wishes his views on high finance to en lighten the readers of this paper. A. V., as some of u still prefer to call him, has always had ideas on how the wicked world ought to run itself, so here is his letter:—

In your report of the Authors' Club After-Dinner discussion you say I spoke of the need of more money in the aviation business.

My point is—We could spend £300,000,000 a year more on aviation and yet have some thousands of millions a year more left over spend on other things. The way to arrive at so desirable a situation is to relinquish our old habit of breaking one of the world's most unenviable records, viz., "excess of imports over exports."

No other country can anywhere near approach our insane record which leads to soul-destroying unemployment, poverty, and over taxation. Other progressive nations foresaw years ago this inevitable result of allowing imports to exceed exports. They accordingly safeguarded their industries, and are amazed at our delay in doing likewise, for they know that when we do, healthy internal competition will automatically bring about extraordinary prosperity, and soul-inspiring opportunities.

When Mr. Baldwin talked of safeguarding some few years ago a number of applications for sites and works came from foreign industrialists. But they ran like rats from a sinking ship when it fell through.

By our folly we are not only holding up our own progress but the progress of the world, for when we fall in line with other leading nations, and introduce a judicious system of safeguarding, we shall all the sooner discover how to trade to our mutual advantage.

It seems inconceivable that a people could be so utterly devoid of sense as to continue importing goods, year after year, to the tune of hundreds of millions that could be advantageously produced in its million odd unemployed, and still more millions of inefficiently employed. Money left and spent in a country, goes on creating wealth for that country, but we send it abroad, without let or hindrance, to help to strengthen rival industries.

Some of your readers may say, "What is this to do with aviation?" It has everything to do with it, for after all is said and done, the

THE HIGHEST AIR FORCE IN THE WORLD.—Pupils and Instructors of the Air Force of the Republic of Bolivia, with Mr. W. H. R. Banting—Chief Instructor—and a Vickers Vespa (Bristol Jupiter) on their aerodrome at Alto La Paz, 14,000 feet.

A HIGH PERFORMANCE ENGINE OF PROVED *RELIABILITY*

The Napier aero engine is an up-to-date engine of proved design.

It has been developed and improved as a result of eleven years' experience in actual service in all types of aircraft.

It develops 570 b.h.p. at 2,585 r.p.m.

It weighs less than 1¾ lb. per h.p.

No other engine has such a record of reliability.

Some recent achievements with Napier production engines.

ENGLAND TO AUSTRALIA
The first formation flight from England to Australia was achieved by four Royal Air Force Supermarine Southampton flying boats each fitted with two Napier engines — 180,800 engine miles without mechanical trouble.

ENGLAND TO INDIA
The first non-stop flight from England to India was accomplished by a Royal Air Force Fairey monoplane fitted with Napier engine — 4,130 miles in 50 hours 38 mins.

THE KABUL RESCUES
600 men, women and children were conveyed to safety by Vickers-Napier Aircraft. Machines had to fly over mountainous country where landing was practically impossible and everything depended on reliability of engines.

industries of any country, including aviation, depend on the productivity and buying power of its people. We therefore cannot be surprised that we are only spending a fraction of what other nations are spending on aviation, and that the Blackpool Airport only had one landing fee of 1s. in four months!

If we produced as much a head as the Americans, we would be over £3,500,000,000 a year better off. We could produce this huge extra wealth with less exertion and worry than we are expending at the present time with the existing inadequate equipment, as we have unrivalled facilities for economical production.

Let us hope that "The Empire Economic Union," which has just been formed by leading industrialists, will put the country on the right track, for when we stop unnecessary imports, we shall enjoy ever-increasing prosperity, and then we can rest assured that aviation will play a big part in the scheme of our affairs.

I reminded the Authors' Club that they could do much towards moulding public opinion.

(Signed) A. VERDON-ROE.

On no account would one dare to argue with the astronomical figures set forth by Sir Aliott Roe. To most of us who are much more intimate with the first two or three figures than with the whole nine figures mentioned by him in his second paragraph, such sums mean absolutely nothing. Consequently we may take him at his word.

But where one does venture to disagree with him is about the epithets which he applies to the state of affairs in this country. We may have a million or so unemployed, but the probability is that 95 per cent. of them are unemployable. Whether they cannot work or they will not work or they cannot keep a job simply because of incompatibility of temper does not matter.

Many of the best workmen one has ever met could not hold down a job for more than a week or two, simply because they could not work alongside other men without quarrelling with them. Also, what with firms going bankrupt owing to fatuous management, and markets falling short, and bad trade in different parts of the world cutting off orders in this country, there are bound to be some hundreds of thousands of unemployed, some of them only temporary.

Short of some form of slavery, under the euphemistic title of "compulsory labour" if you will, there is no way of employing these million or so unemployed. And a very large proportion of them are physically or mentally incapable of doing an honest day's work if it was set for them to do.

Apart from that, the working classes of this country are in fact better fed and better housed and better clothed and better amused than are the working classes of any other country in the world,—including the United States. There is probably less real poverty in this country than in any other. And though we may appear to be overtaxed, one notices that most of us are now living in greater comfort than we did before the war. At any rate, such is obviously the case so far as all the members of the Aircraft Industry are concerned.

Certainly protection is not going to make any man work any harder than he does at present. If we produce less per head than the Americans do, as Sir Aliott Roe alleges, then that merely proves that we do not work as hard as the Americans do or as intelligently.

One is certainly entirely in favour of what he calls the Empire Economic Union. But before we can expect our Overseas Dominions to trade with us, our manufacturers must see to it that we offer them articles which are just as good as are offered by our competitors in America and in Germany, and at the same price. There is no reason why an Australian buyer should pay more for an aeroplane than he is asked to pay for an airplane. And as yet there is no dumping.

PATRIOTISM.

And that brings us to the question of Overseas Trade again. Last week's leading article has not made me any more popular with those good old-fashioned manufacturers in this country who would like to be spoon-fed by the Air Ministry in the comfortable shade of a tariff wall.

They hate the idea of having to go out and work for their livings against foreign competition. But sooner or later they will have to do it, or starve. And so the sooner they start the better.

Here are a few outside opinions to encourage them. The first is from Wanstead—near where A. V. Roe made his first flights:—

Allow me to thank you for a thoroughly enjoyable quarter of an hour on Patriotism. Surely it is unjust to accuse anyone of being unpatriotic because they are trying to open the eyes of the die-hards.

As you say, the United States are composed mostly of our own race, and no doubt they have enticed some of our best brains to that country for their own benefit. But there must be many men as good and better still in the Old Country, who, but for the want of capital could go ahead and knock spots off all our rivals, both in design and business methods. You mention the fact of there being plenty of capital available for this purpose—if so, why is it not more widely advertised?

There is young blood and there are splendid brains hungering for the opportunity to get going, only to find that the best offers are to be obtained from our rivals.

I only hope that "straight left" of an article of yours gets home to the right spot, and may it not be your last on the subject.

"PATRIOT"

Following that is a letter from Mr. Stuart Hirst, a successful business man in Leeds, a pioneer of British Aviation who had the sense to make a fortune outside of flying and stick to it. He says:—

I feel I must congratulate you upon your lucid and masterly statement regarding the position of the British Aircraft Industry. I think your comparisons with the cycle trade and the motor trade are absolutely apropos, and I not only hope that you will be credited with impartiality but that your statement will be taken to heart by British manufacturers.

The fact of the matter is, it is not so much the engineer or the designer who is the first to foresee the trend of design. These people simply carry out what such people as *we* divine as public demand and public taste. The mistake is that too often they think themselves the whole shoot.

All honour to our engineers and designers for what they have accomplished, but too often do they need more vision; and your lead, I think, will be valuable.

While coming of an old family of engineers, I am not an engineer myself, but in regard to the trend of design, I have frequently indicated developments which have subsequently come to pass—notably in my address on "Civil Aviation," which, on behalf of the Blackburn Company, I gave at the Savoy Hotel on April 7th, 1919, when we were celebrating the exhibition in London of the first post-war civil machine.

British designers have got to jettison a lot of their old ideas and cudgel their clever brains in order to devise and build types that will fill immediate needs, and, as you say, we can learn a great deal from the Americans in foresight and adaptability.

With renewed thanks to you for your enlightened attitude and your definite service to British aviation.

And so, even though some of our old die-hards do not like having new ideas put before them, I propose to go on publishing the latest available information, in the knowledge that if they do not make what the market wants, some younger and cleverer man or firm or nation will do so.—C. G. G.

ALTITUDE TRAINING.—Mr. H. W. R. Banting and Mr. Siemel (with camera) on the Alto La Paz Aerodrome (14,000 ft.) just before starting in the Vickers Vespa (Bristol Jupiter) for a 2½ hour flight to Illimain 24,200 ft., and Illampu Lake 25,000 ft.—without oxygen or supercharger.

'PLANES 8,700 MILES.

Cairo to West Africa and Back.

CAIRO, Friday (Reuter).—The R.A.F. flight to West Africa and back finished at noon to-day, when three Fairey 3F. planes landed at Helouan after covering 8,700 miles without a hitch. The flight began on October 19. The planes visited Nigeria and the Gold Coast, landing at Lagos, Accra, Maiduguri, and Tamale, among other places.

Extract from press, November 29, 1929

FAIREY AIRCRAFT

COMPLETE RELIABILITY DURING AN AGGREGATE OF OVER 26,000 MILES OF TROPICAL FLYING

* * *

For several years now, since its inception, the annual Royal Air Force African operations have been undertaken by a number of Fairey Aircraft from units stationed in Egypt. These annual flights, of which there are two, one known as the Kano and the other to the Cape, are of a very extensive nature involving many thousands of miles of flying near the Equator, including co-operation manoeuvres. That Fairey Aircraft should be chosen regularly for these arduous duties affords a definite indication of their exceptional merit.

SEAWORTHINESS AND AIRWORTHINESS.

[Nobody in this country, or in any other, knows more about seaplanes, including flying-boats, than does Mr. Oswald Short, of Short Bros. Ltd. of Rochester. Consequently his letter, which follows, is of outstanding importance. After it will be found a discussion of some of the points which he raises.—C. G. G.]

In the last few issues of your journal there have appeared several articles from your pen with reference to the design of flying boats, following upon the recent loss of the *City of Rome* in the Mediterranean.

In these articles you have, generally speaking, classed all existing types of flying boats as unseaworthy, and in the first article on this subject you particularly criticised three engined machines as being, in your opinion, useless so far as the prevention of forced landings are concerned. The question thus raised is an interesting one to those who follow aircraft development, and naturally aircraft constructors have something to say on the subject.

In the first instance, the impartial observer must fail to see any indication of a "craze" for three-engined aircraft, such as you suggest exists, as he will equally fail to see a craze for single-, double-, or quadruple-engine systems in aircraft. The three-engined aircraft has arrived in the natural course of aircraft development where designers, faced with certain specifications of requirements, have set out to meet those requirements with the use of existing types of engines and materials.

No one to the writer's knowledge has claimed infallibility for three-engined machines. It would be equally illogical to claim infallibility for machines fitted with four, six or any number of engines. The word is indeed scarcely applicable to any man-made apparatus.

What has been claimed, however, and also proved beyond all doubt, is that the multiple-engine system, in certain specific designs, greatly reduces the risk of forced landings. Certain twin-engined machines will fly with the full designed load on one engine, and certain three-engined machines will fly quite strongly with one engine stopped.

This property is not necessarily achieved by a wastage of power, or by carrying a very light and uneconomical load. On the other hand there are three-engined machines, and even four-engined machines that will not fly with one engine stopped. It is a question of design, and of the reserve power available for flight in a particular machine.

The "Calcutta" type of flying-boat may be taken as one instance of an aircraft that will fly well on two engines out of three, while carrying quite a big commercial load. The figures are,—Pay load 6,250 lbs. plus petrol and oil for 300 miles in calm air.

Controllability in the case of one engine stopping is naturally not improved, but it is reasonably good, and quite effective, and the machine can be turned against the offset thrust-line with either starboard or port engine stopped. With improvements in the design of both engines and machine, in course of time the three-engined aircraft will leave little to be desired as regards performance and controllability on two thirds of its maximum power.

In the case of a four-engined aircraft, flight with one engine stopped should on the face of it be easier to accomplish, but at the present moment it must be admitted that there is no four-engined boat in use that will fly as well on three engines as the Calcutta flies on two. In fact it appears that there is no four-engined boat which can compare with the Calcutta type as regards pay-load carried and range, and general performance, although existing four-engined boats have 25 per cent. more power available for flight.

That being the case, there is no justification for implying that British designers are behind the times in flying-boat construction, as you appear to do in your references to four-engined machines and to the Dornier type in particular.

That leads us to consider the question of types of flying-boats.

There is a strong tendency on the part of some writers to favour the monoplane flying-boat, and to assume that the biplane flying-boat with a central hull and wing-tip floats is obsolete in design. The principal cause of this tendency of thought is the feeling that wing-tip floats are unsatisfactory where the seaworthy qualities of a flying boat are being considered.

The tendency may also be due to a feeling that a type which has remained so long in existence without apparent alteration must necessarily be obsolete in design. It is, however, perhaps time to say that no machine is obsolete until something better exists to replace it. If that be the case, then certainly the type of flying-boat which has come to be looked upon as peculiarly British is still the best.

Designers cannot successfully sacrifice every other good point in flying-boat design to obtain maximum seaworthiness. A flying-boat is essentially a compromise to the requirements of two elements—air and water. A flying-boat which gets off quickly, climbs rapidly, has a high ceiling and a big speed-range, is probably much safer as a vehicle of the air than one which is deficient in those properties, but is more seaworthy.

When we read, as we frequently do, of vessels of thousands of tons displacement foundering in rough seas, we must realise that a great problem faces the flying-boat designer, who, in the light of present knowledge of flying-boat design, has to build a vessel which cannot furl its sails in emergency. Flying boats as at present designed, however, have demonstrated that they have a considerable degree of seaworthiness.

Rough as the sea was which sank the *City of Rome*, she would probably have survived if she had not been taken in tow. It is quite possible that she was towed under, as has happened to bigger surface craft on many occasions.

It becomes clearer every day that the work of flying-boats is to fly from one stretch of sheltered water to another. Designers will not spare any efforts to obtain the utmost degree of seaworthiness possible under all the requirements of flying-boat design, but when that is done a flying boat battling in a hurricane in the Mediterranean or Mid-Atlantic is out of place. Its place between ports is in the air, and our greatest efforts should be directed towards keeping it there.

(Signed) OSWALD SHORT.

Mr. Short's letter is of unusual interest, particularly so because it gives the opinion of one of the most progressive aircraft constructors in the World. Mr. Oswald Short together with his brother, the late Mr. Horace Short, were responsible for what were in fact the first successful seaplanes in Europe. Ever since those early days of 1911 or 1912 he has been continually engaged in the design and construction of seaplanes.

THE CALCUTTA AT HOME.—A Short flying-boat (thr ee Bristol-built Jupiters) bought for comparative tests by the French Government.

PROOFS THAT CIRRUS ENGINES ARE

THE WORLD'S MOST RELIABLE LIGHT AERO ENGINES.

¶ The great majority of Light Aircraft of British manufacture are fitted with CIRRUS or CIRRUS HERMES engines.

¶ There are more different types of Light Aircraft of Foreign manufacture fitted with Cirrus engines than with any other power unit.

¶ Cirrus engined aircraft won the King's Cup in 1926 and 1927 and the Siddeley Trophy in 1928 and 1929.

¶ Cirrus engines are in use by the British Royal Air Force and are standardised by National Flying Services Ltd.

¶ Cirrus engines are now fitted in over 40 different types of British and Foreign Aircraft.

¶ Cirrus Hermes engines are now fitted in 19 different types of British and Foreign Aircraft.

¶ The record of Cirrus engines in World Flights, International Competitions, Racing, and in every other activity in which Light Aircraft are employed cannot be approached by any other type of British or Foreign low powered engine.

CIRRUS SUPREMACY IS FOUNDED UPON CIRRUS PERFORMANCE.

CIRRUS AERO ENGINES LTD.,

From the ordinary type of float seaplane he has extended his experience until to-day he is the constructor of some of the largest and quite the most successful flying boats in the World. To-day he has abuilding a four-engined flying-boat with a stainless steel hull and a three-engined monoplane on floats,—each marking still further progress intellectually and mechanically.

At the beginning of his letter Mr. Short really combines two separate issues which one has discussed in this paper. One is the seaworthiness of flying boats as such, the other is the efficiency of three-engined aircraft as such. Let us deal with the latter subject first.

When one has referred to the craze for three-engined aircraft one has had in mind the fact that practically all over the World aircraft manufacturers are turning out both sea-planes and land-planes with three engines, disposed in a variety of ways. Possibly one might have referred to the popularity of three-engined aircraft rather than to a craze for such an arrangement of engines. Or one might have used a phrase which Mr. Short himself has used when he refers to "a strong tendency in favour of monoplane flying boats." Be that as it may, there is undoubtedly a large number of three-engined machines of one kind or another being built to-day.

The majority of these three-engined aeroplanes have fuselages of the normal type. And whether they be biplanes or monoplanes they almost invariably have one engine in the nose of the fuselage and one engine attached somehow or another to the wings or between the wings, one on either side of the fuselage.

The objection to this most popular type is that if you put an engine, whether big or small, in the nose of a big fuselage, where practically the whole of the diameter of the air-screw is blanketed by the mass of the fuselage behind it, the air-screw simply cannot do its job.

This objection applies equally well to any form of tractor aeroplane. In the ordinary single-seater or in the two- or three-seater machine, in which the pilot and passengers sit in tandem, the fuselage is comparatively small compared with the size of the engine and the air-screw, and the effect is less bad. But in big passenger-carrying machines the area of the fuselage in cross-section is sometimes actually bigger than the area swept by the air-screw.

With more modern aircraft and more modern engines this objection is overcome to some extent by using geared engines in which the air-screw is so much bigger than it is when it is driven direct that there is enough of the air-screw blade outside the area of the fuselage to give it some chance of doing useful work. But even so a great deal of the effective area swept by the air-screw is still blanketed by the fuselage, and consequently the middle engine of the three cannot possibly do as much useful work as is done by each of the wing engines.

Consequently the efficiency of a twin-engined aeroplane in which the power of the two engines together is equal to the combined power of three engines in a tri-motor aeroplane is invariably higher than that of the tri-motor machine,—other things being equal.

Three engines *can* be arranged so that all three can be equally effective. For instance, some years ago Mr. Koolhoven, the famous Anglo-Dutch designer, built a three-engined monoplane in which the two wing engines were slung under the wings in the way first popularised by Mr. Antony Fokker and the third engine was carried on a kind of trestle on the top of the fuselage. This method certainly should be more efficient than putting the third engine in the nose of the fuselage.

Engines have been since, or possibly before, arranged on trestles in this kind of way both by Dr. Dornier and by Dr. Rohrbach, and by the Italian Savoia firm.

The method used by Mr. Short himself in his Calcutta flying boat is another way of doing it. In the Calcutta, as the three engines are arranged in line mid-way between the planes and above the hull of the flying-boat, each engine has just about the same amount of obstruction from struts and wires and engine-mountings behind it. Whichever engine cuts out it does not seem to make much difference to the power delivered by the other two.

The only difference is that if the middle engine cuts out it may affect the rudder and elevator controls more than if a side engine cuts out,—because it will remove the slip-stream from the tail unit. On the other hand, if the middle engine cuts out and the two wing engines keep going, at any rate there is a properly balanced pull on each side of the machine, and the engines do not have to drag the machine against the rudder, which has to be held over to counteract the loss of the dead engine on one side.

Where four engines are used, as in the new big Fokker monoplane, which was unfortunately crashed in America the other day, then all four engines, as they are slung two in tandem on each side of the fuselage, are free from the obstruction of the fuselage and there seems every probability that they are more efficient than any possible three-engine arrangement. This tandem arrangement has proved itself very successful in the Dornier Flying Boat and in the Savoia.

There is, however, some difficulty in using air-cooled engines arranged in tandem,—as has been proven. If the front engine happens to stop, the aft engine suffers from over-heating, and even when there are four engines, if one of the forward engines stops, the boat has to come down because shortly after one engine has stopped its rear engine will also stop. This trouble, however, can be got over by a proper and skilful arrangement of the cowling round and between the two engines and particularly over the rear engine.

One quite agrees with Mr. Short that apparently there is no four-engined flying-boat which can compare with the Calcutta, power for power, and size for size, for efficiency and performance. All the four-engined seaplanes or flying-boats of which one has heard are of the heavy German monoplane type, in which there is still an immense amount of room for improvement. The Calcutta, on the other hand, represents just about the last word in the development of the braced bi-plane type of structure as applied to flying boats.

In this type of aircraft, which includes also the Blackburn Iris and some of the later developments of the Supermarine Company, we in this country appear to be far ahead of any other nation. And one feels sure that Mr. Short himself and Major Rennie of the Blackburn Company, and Mr. Mitchell of the Supermarine Company, would themselves never think of claiming that they are at the end of the development of this type.

Never for a moment did one think of implying that British designers are behind the times in flying-boat construction. We, in this country, certainly know far more about hull design and about the best way of attaching the wing structure to the hull than do any foreign constructors. But one does rather think that a four-engined tandem arrangement similar to that of the Dornier, if applied to any of our big flying-boats, might make an even better job of them.

The strong tendency or craze on the part of some writers to favour the monoplane flying-boat, to which Mr. Short refers, has never found place in THE AEROPLANE newspaper. With the exception of the Dornier Do.X one has never seen any monoplane flying-boat which looks as if it would be anything like as sea-worthy as a Short or a Blackburn or a Supermarine.

Mr. Short says, that no machine is obsolete until something better exists to replace it. That is an aphorism worth remembering. But at the same time one can fairly say that any existing type becomes at any rate obsolescent as soon as anything is in sight which looks like replacing it. Common rumour in the aircraft industry has it that Mr. Short is building an enormous three-engined monoplane on

ON CIVIL SERVICE.—A Short Calcutta (three Jupiters), belonging to Imperial Airways Ltd., moored in Tobruk Harbour.

Digitized by Google

floats. In fact, it is said to be so large that the floats themselves amount almost to being twin boat-hulls. If this rumour be true, then Mr. Short is engaged in an exceedingly interesting experiment.

He would seem to be combining his own unrivalled experience of seaplane floats and flying-boat hulls with the Italian Savoia idea of a twin-hulled monoplane flying boat. If as yet we know too little about such a type of aircraft to say that it makes all our big flying boats even obsolescent, the experiment itself is at any rate a noteworthy effort in the direction of progress. And Mr. Short deserves full credit for it.

The real point at issue between Mr. Short and the present writer is the interpretation of the word "seaworthiness." One quite agrees that, so far as any flying-boat with wings permanently attached can be sea-worthy, we in this country have come as near producing a sea-worthy flying-boat as anybody is ever likely to get.

If we build an enormous flying-boat of the size of the Dornier Do.X then we shall achieve as much sea-worthiness. We may even achieve more, for as yet nobody knows how much hammering in an open sea the Dornier Do.X is likely to stand.

But of one thing one is absolutely certain. That is that even if we built a flying boat as big as the *Mauretania* it would still be un-seaworthy judged by the ordinary mariner's standard of sea-worthiness.

When one reads of what high seas in the Atlantic do to our giant Atlantic liners, one realises how much more they would do to any kind of flying-boat, in which the wings would necessarily be of greater area than the hulls of the flying machine itself. The greater the area exposed to the wind and the waves, the greater must be the damage done.

As a matter of fact the damage which is done by giant waves is not done by the waves overtopping the structure and falling on it. It is done because the waves are obstructed by huge hull, pile themselves up against the side of the hull, or against the bow, and simply overflow onto the deck and carry away whatever may be moveable thereon.

Great waves cannot be withstood but they can be dodged. Which is precisely why a small lifeboat can go over and through waves which are smashing the hull of a great ship.

The conclusion then is that the building of a sea-worthy flying boat is impossible. Also that the building of an infallible engine is impossible. Therefore, we can never hope to have flying-boats which will never be compelled to come down in the water and we can never have a flying boat which can live in a heavy sea when it is down.

The obvious thing to do is to set about designing, first of all, a flying-boat or float sea-plane or twin-hull flying machine which will be as nearly as possible infallible in the matter of forced alighting, and can, when it is forced to alight in such a sea as cannot be withstood by the wing structure, get away from the said wing-structure and save the lives of the crew and passengers in a detachable motor lifeboat.

Such a machine need not be of very great size. There never is any need for an aircraft to be of any great size. But such a machine will be produced some time or another as a commercial proposition.—C. G. G.

ANOTHER SIDE OF THE PICTURE.

The Times of India of Oct. 11 published criticisms of the Imperial Airways arrangements from a recently arrived passenger.

This passenger, while admitting the skill of the technical side, said that there appeared to be a very serious shortage of pilots and an insufficient margin of reserve men for emergencies, resulting in serious over-work.

It was not uncommon for a pilot to arrive at his destination after a tiring flight to find that he must start within a few hours on the return journey, though this may have been due to an unforseen occurrence.

His second point of criticism was to the effect that there is apparently a similar shortage of machines, resulting in serious delays. His third complaint is of poor arrangements on some parts of the journey in the matter of the passengers' feeding accommodation. For instance, he says that, on arriving at Lingeh, the half-way house on the long flight from Basra to Jask, he found no accommodation.

A native clerk, representing Imperial Airways, could produce only two string beds, without bedding, and food was only available in the Persian bazaar. The machine had, moreover, to risk a night landing, and to proceed to Jask, where the rest-house was quarantined, and the party had to be entertained for the night in the bungalow of the telegraph department.

The remaining stopping-place, Gwadar, was equally uncomfortable. The accommodation there was a small tent, while a few dry sandwiches and undrinkable tea, prepared by the native watchman, was all the available food that the passengers obtained between their departure from Jask at daybreak and their arrival, late in the afternoon, at Karachi. Finally, at Karachi, there were no feeding arrangements at the aerodrome. Other places were found to be satisfactory.

IMPERIAL AIRWAYS ACCIDENTS.

In the House of Commons on Dec. 4, in reply to Mr. Le[illegible] the Under-Secretary of State for Air said that since the institution of Imperial Airways nearly six years ago there had been in all five fatal accidents to aircraft of the company, of which four had been on regular service. The number of persons who had lost their lives had been 19 passengers, nine employees of the company and one Government servant. There had been, in addition, five accidents in which the aircraft had been wrecked or seriously damaged but none of these had caused any personal injury. The aircraft had been of various types but for the most part without distinctive names.

Replying to Capt. Balfour, Mr. Montague said that as far as he knew the log-books of the *City of Rome* were in the possession of the Commission which had been inquiring into the accident.

CIVIL AVIATION IN INDIA.

In the House of Commons on Nov. 4, in reply to a question by Major Pole, Mr. Wedgwood Benn, Secretary of State for India, said that up to March of this year the Government of India had expended about £240,000 on civil aviation. Of this £30,000 had been a contribution to the Imperial airways scheme and the rest had been mainly spent on ground organisation. A further sum of about £180,000 had been provided in the current year's estimates, which included about £26,000 as a contribution to the cost of the proposed Karachi—Delhi service. About £28,000 would have been contributed to light aeroplane clubs during the two years ending next March. He could not say when the Karachi—Bombay service would be in operation. Mr. Benn then circulated a statement in the *Official Report* which reads:—

The expenditure of the Government of India on civil aviation including the cost of provision of wireless and meteorological facilities during the last five years is as follows:—1925-6, £9,150; 1926-7, £[illegible]; 1927-8, £76,250; 1928-9 (Revised Estimate), £39,300; 1929-30 (Budget Estimate), £178,050; Total £400,720.

The figures for 1929-30 include a sum of £26,250 as six months' subsidy for the Karachi—Delhi extension of the London—India Air service.

The figures for 1928-29 and 1929-30 together include a sum of £[illegible] representing the assistance given by the Government of India to four light aeroplane clubs in India. This assistance is in the form of the supply to each club of two D.H. Moth aeroplanes and a spare engine, an annual maintenance grant of £1,500, a grant of £675 towards the provision of a hangar, and a bonus of Rs.150 (approximately £[illegible]) per pilot for a limited number of pilots trained by the clubs.

The clubs are under the control and supervision of the Aero Club of India and Burma, which, in return for the services it renders in this connection, has received from the Government grants of £2,250 in each of the two financial years 1928-9 and 1929-30.

A scheme for training Indians in civil aviation by means of Government scholarships in this country, estimated to cost £15,900 over a period of seven years, is also in operation.

The total estimated expenditure of the Government of India on civil aviation during the four years 1929-30 to 1932-33 (subject to the approval of the Legislative Assembly) is £1,250,000 (including meteorological and wireless facilities).

Of this sum, £375,000 represents the estimated cost of subsidies for the operation of trans-India air services.

THE FOKKER COMBINE IN THE U.S.

The General Motors Corporation, the biggest automobile combine in the World, has acquired 400,000 shares of Fokker common stock, or a 40 per cent. interest, in the Fokker Aircraft Corporation.

As the result of this deal General Motors is turning over to the Fokker Company all the capital stock of the Dayton-Wright Company, the assets of which include McCook Field, Dayton, Ohio, a number of patents, and cash assets of $6,500,000 (£1,300,000).

General Motors also owns 2 per cent. of the stock in the Bendix Aviation Corporation which was recently formed to take over the Bendix Brake Co. and the Eclipse Machine Co., makers of the Bendix aero-wheel brakes and the Eclipse engine-starters respectively.

The present personnel of the Fokker Aircraft Corporation will remain unchanged but will be augmented with additional staff from General Motors.

Under the new arrangement full advantage will be taken of the General Motors World-wide distribution system for the marketing of Fokker aircraft.

Presumably the United Kingdom and Canada will be barred by the agreement between A. V. Roe and Co. Ltd. and the Fokker firm.

AVIATION ESPIONAGE IN GERMANY.

On Nov. 23 the Supreme Court at Leipzig sentenced three men charged with espionage to terms of imprisonment ranging from six to three years. One of the men was an employee at the German Aeronautical Research Institute and was charged with conveying a secret drawing to a foreign Power. The other two men were charged with complicity.

Although Germany is forbidden by the Versailles treaty to have any military aircraft the Court decided that secrecy over certain matters was necessary in the interests of national defence.

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

ON THE GUGGENHEIM CONTROVERSY.

There are always two sides to every question, and the other side to the Curtiss Tanager *versus* Handley Page Gugnunc controversy over the Guggenheim Competition deserves a full hearing.

As was made fairly clear in the article on this Competition in THE AEROPLANE last week we of THE AEROPLANE are not in the least concerned about patent rights or anything of that kind. What does concern us is the policy involved on each side, with the idea that good sportsmanship and good policy are in the end one and the same thing in an international competition of this kind. That is to say, the competition should be fought in the best sporting spirit and any legal questions should be fought out afterwards.

The other side of this argument is that the Curtiss Co. did not act in a properly sportsmanlike spirit either.

As most people connected with aviation know, the U.S. Navy bought the use of the Handley Page Slot patents a good many years ago. As part of that purchase the technical people of the U.S. Naval Air Service are entitled to know all about the latest developments under the Slot patents.

Consequently certain information about the automatic slots was sent to the U.S. Navy Bureau. And the Navy Bureau quite reasonably wanted experiments made on the strength of this information with a type of wing which is commonly in use in the U.S. Naval Air Service.

Therefore the Curtiss Co. were given an order to produce an experimental machine, with a wing of a section which is peculiar to that firm, fitted with automatic slots used according to the latest Handley Page method,—apparently a method which is not yet in use in this country.

On the day fixed as the last on which machines for the Guggenheim Competition could be presented by competitors for test the Curtiss Tanager arrived, with wings of the precise section used in the Navy's experimental machine, with automatic slots used according to the latest Handley Page principle. And apparently it was accepted without question by the controllers of the Competition.

Quite incidentally, as it has no direct bearing on this argument, the Tanager also has, instead of ordinary ailerons, balancing planes, similar to those used on the Hill Pterodactyl and called controllers instead of ailerons by Captain G. T. R. Hill, the designer. These are aerofoils projecting beyond the wing-tips and allowed to float without any angle of incidence in the air. They are so arranged that they float thus no matter what the angle of the main plane and of the machine itself may be. Consequently whatever the machine is doing these controllers can never become stalled, unless they are deliberately stalled by the pilot.

Anyhow, the point is that the Curtiss people sprung this machine on the other competitors without having indicated in any way to the Handley Page firm that they were going to use slots. They apparently justify themselves by saying that they built the machine in the interests of scientific progress without bothering whether they infringed anybody's patent or not. Which seems reasonable as an argument.

What seems to have raised Mr. Handley Page's ire, also very naturally, is that they never said anything to him about it. If they had said in effect "We are going to use slots and we don't care whether they are your patent or somebody else's patent, we are just going to see what is the best that can be done with a slotted machine under the rules of the Competition, and as we happen to have built a rather nice job on these lines for the U.S. Navy we are going to use that information in our Guggenheim competition machine," the probability is that no objection would have been raised.

Possibly, even probably, Handley Page Ltd. might have pushed in a writ for infringement of patent, but the probability is that there would not have been any objection to the machine as a competitor in the Guggenheim trials. A legal objection and a sporting objection are two entirely different things.

As the matter stands at present, an official objection to the machine has been lodged and there is a possibility of legal action following. All of which is very sad, and is very good for the lawyers, but it is not particularly good for the progress of aviation on either side of the Atlantic.

Over and above all this, the rules of the Competition seem to have been interpreted rather freely, or even loosely, —which may have been good sportsmanship, or may have been because so few machines were entered, that, at the finish, to make a field, machines had to be admitted which ought to have been disqualified. One machine in particular was admitted days late because it had started from home on the day for presentation, and was delayed by bad weather. Another broke a crankshaft and was allowed to wait till a new shaft could be got from Europe.

However, the Tanager and the Gugnunc seem to be the only serious competitors. And we must now wait and see which is adjudged the winner. There seems to be no fixed date for the end of the Competition, so presumably the tests will go on until one or the other is completely written off.—C. G. G.

ON THE GUGGENHEIM COMPETITION.

An American correspondent who has been watching the Guggenheim Competition writes as follows:—

The Guggenheim competition is coming on very [illegible] as you have doubtless heard. Unfortunately, a good [illegible] of the entries never showed up. Cierva, I guess, [illegible] dare send his autogiro.

The most interesting entries are the Handley Page, [illegible] Curtiss Tanager, the Cunningham-Hall ship, and a [illegible] machine designed and built by Major Schroeder. The [illegible] two named have had practically no test work done on them and even their designers do not know what their performance is. [The latter has crashed since then.—ED.]

The Cunningham-Hall was flown two or three times [illegible] then the crankshaft in the motor broke. The motor [illegible] a new type of Walter engine, there was no other [illegible] America, and they are now waiting for a new one to come from Prague. Schroeder's ship had never flown but [illegible] arriving here in a truck, and I believe has been cautiously flown several times since.

The Handley Page ship is, to my mind, the most promising, because everything on it is purely automatic. The Curtiss Tanager is fitted with automatic slots, but the [illegible] is manually operated. It is also equipped with an ingenious type of floating aileron which is attached to the end of the lower wing and counter-weighted so that it is never stalled no matter what the angle of the wing is.

Of course, the result of these tests is still somewhat secret, so please do not quote this as being authentic, but I am pretty darn sure that there is quite an argument [illegible] between Handley Page and the Guggenheim Fund in regard to the slow speed of his machine. I have gotten this from the pilots and not from any of the officials.

They have been trying to get the low speed by dragging a pitot-head below the ship; and I have found in my experience that this is not a very accurate method as it is possible to get quite different readings with the same equipment. Mr. Handley Page, of course, is backed up by the Martlesham Heath tests, and I think should be fairly able to prove his case.

I only hope that they do not break either of the machines before they get through testing them, because landing them over the barrier they certainly come down with an awful bang and all of them have broken wheels and under-carriage struts so far.

I do not believe much in this slow landing speed and gliding speed myself, because the result is that both the Tanager and the Handley Page entries have to be led out onto the field with a man on each wing if the wind is blowing over twenty miles an hour.

This is the same trouble we have had with Avians and Moths and is very annoying. It makes an airplane decidedly impractical, because sooner or later, if a ship of this type is used extensively, one will land under conditions where the men are not available and turn the machine over.

Practically everybody who has flown a Moth or an Avian to any extent in America has had this happen to them once or twice. Whereas with a machine that lands around fifty miles an hour, it takes practically a hurricane to have much effect on it once it is on the ground. And with good brakes it can be pulled up very short.

A CHANCE FOR THE INDUSTRY.

The Bombay correspondent of *The Times* says that the firm of Tata and Sons Ltd. have written a letter to the Bombay Municipal Corporation in which Tata and Sons Ltd say they have approached the Government of India for a contract for an air service between Bombay and Karachi to link with the Croydon—Karachi service.

If the Indian Government approves the scheme, Tata and Sons Ltd. will make arrangements to buy aircraft so that a start may be made before the next monsoon.

Tata and Sons Ltd. are said to be the largest steel firm in India, and to have immense resources. They do not build aircraft, so they will have to buy them.

Such a firm is not likely to start a route of this kind unless they believe that one day soon air lines will be wanted all over India and because on a short route of this kind useful experience can be gained.

To operate this short route with aircraft that they could later build under licence would be, one imagines, an attractive proposition to this Indian firm who would thus be able to supply the *matériel* required for India's own air lines. Perhaps the Industry in this country will look into this chance and act accordingly.

A RIVAL FOR THE CALCUTTA.

The French Government have recently acquired a Short Calcutta flying-boat for service on the French air lines.

Now comes a statement from the *Vossische Zeitung*, the German newspaper, that the French Government has placed an order "on reparation account" for a Rohrbach-Romar flying-boat of the type of which three samples have been ordered by the Deutsche Luft Hansa for eventual use on an Atlantic service by stages to South America. The price is stated to be about £50,000.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, December 3.

ROYAL AIR FORCE.

;ENERAL DUTIES BRANCH.—E. M. Morris is granted a S.S. comn. as . Off. on probation with effect from and with seniority of Nov. 6. ;roup Capt. J. R. W. Smyth-Pigott, D.S.O., is placed on the half- list, Scale B, Dec. 2, 1929, to Dec. 1, 1930, inclusive; Flg. Off. Rigby is placed on the half-pay list, Scale B, Oct. 6 to 7 inclusive. Ving Cdr. G. F. Pretyman, D.S.O., O.B.E., is placed on the retired on account of ill-health (Nov. 30); Flt. Lt. B. J. W. Brady, D.S.M., placed on the retired list at his own request (Nov. 28); Flg. Off. L. Drew is transferred to the Reserve, Class A (Dec. 1); Mate H. Gardner, R.N., Flg. Off., R.A.F., relinquishes his temp. comn. return to Naval duty (Nov 7).

RESERVE OF AIR FORCE OFFICERS.

;ENERAL DUTIES BRANCH.—Plt. Off. on probation A. N. Spottiswoode confirmed in rank (Sept. 27); Flg. Off. K. Maconochie is transferred m Class A to Class C (Dec. 3).

'he following Flg. Offs. relinquish their comns. on transfer to the lian Army:—A. T. S. Studdert (Sept. 13); R. J. Stevens (Oct. 22). : Off. E. M. Morris relinquishes his comn. in the Special Reserve appointment to a S.S. comn. in the Royal Air Force (Nov. 6).

;RRATUM.—In *Gazettes* of Dec. 6, 1927, July 24, 1928, and Aug. 6, '9.—*For* M. E. Morris *read* E. M. Morris.

AUXILIARY AIR FORCE.

;ENERAL DUTIES BRANCH.—No. 600 CITY OF LONDON (BOMBER) UADRON.—The following to be Plt. Off.:—G. P. Kerr (Nov. 2).

'RINCESS MARY'S ROYAL AIR FORCE NURSING SERVICE.—Staff Nurse ss G. F. H. Lloyd is promoted to the rank of Sister (Oct. 4).

Appointments.

Week ending December 9.

;ENERAL DUTIES BRANCH.—Group Captains W. F. MacN. Foster, .E., D.S.O., D.F.C., to No. 1 Air Defence Group H.Q., to command, e Air Commodore E. L. Gerrard, C.M.G., D.S.O., 11/11. M. Spicer, H.Q., Inland Area, Stanmore, for Engineer Staff duties, on' asing to be seconded to the Royal Australian Air Force, 12/11.

Wing Commanders J. T. Babington, D.S.O., to Air Ministry (C.A.S.), appointment as Air Representative to the League of Nations, 11/11. E. Sutton, D.S.O., O.B.E., M.C., to Special Duty List, for duty as structor at the Imperial Defence College, 11/11.

Squadron Leaders L. H. Slatter, O.B.E., D.S.C., D.F.C., to No. 111 dn., Hornchurch, 23/10. C. F. Gordon, O.B.E., M.C., D.F.C., to and G. School, Eastchurch, 8/11. R. G. Gardner, D.S.C., to R.A.F. pot, Uxbridge, 4/11. W. S. Caster, M.C., to Experimental Section, A.E., S. Farnborough, 20/11. E. B. C. Betts, D.S.C., D.F.C., to Q., Aden Command, 16/11.

Flight Lieutenants J. H. Hagon, to H.Q., Coastal Area, 14/11. G. S. ddie, D.F.C., A.F.C., to Experimental Section, R.A.E., S. Farnborough, /11. S. P. George, to R.A.F. Depot, Uxbridge, 12/10. C. Crawford, A. and G. School, Eastchurch, 15/10. A. J. E. Broomfield, D.F.C., No. 58 Sqdn., Worthy Down, 3/11. G. H. Vasse, to A. and G. hool, Eastchurch, 21/10. G. M. Lawson, M.C., to R.A.F. Depot, xbridge, 25/11. E. A. Hodgson, to C.F.S., Wittering, 3/10. W. A. ncan, to R.A.F. Depot, Uxbridge, 3/11. P. Murgatroyd, to Aircraft pot, 'Iraq, 22/10. V. B. Bennett, to H.Q., R.A.F., India, 20/11. R. D. Swain, to No. 6 Sqdn., Middle East, 13/11. R. W. G. Lywood, R.A.F. Depot, Middle East, 1/11.

Flying Officers D. D. MacA. Eastwood, to R.A.F. Depot, Middle East, 11. R. D. Adams, to R.A.F. Depot, Uxbridge, 12/10. F. D. Biggs, to No. 207 Sqdn., Bircham Newton, 18/11. V. S. Bowling, to No. 501 Sqdn., Filton, 9/11. P. G. Lucas, to No. 41 Sqdn., Northolt, 12/11. A. W. H. Nelson, to E. and W. School, Cranwell, 1/11. J. Parsons, to No. 5 F.T.S., Sealand, 1/11. E. M. Thompson, to Station H.Q., Donibristle, 1/11. W. F. Bryanton, to R.A.F. Depot, Uxbridge, 21/10. W. R. J. Spittle, to R.A.F. Depot, Uxbridge, 12/10. C. K. J. Coggle, to No. 3 Sqdn., Upavon, 15/11.

Pilot Officers R. A. Sprague, to No. 6 Sqdn., Middle East, 13/11. F. S. Barron, to No. 47 Sqdn., Middle East, 6/11.

MEDICAL BRANCH.—Squadron Leader T. Montgomery, M.B., D.P.H., B.A., to R.A.F. Combined Hospital, Aden, 16/11.

Flight Lieutenants (Hon. Sq. Ldr.) J. W. H. Steil, M.B., to Station H.Q., Kenley, on appointment to a temp. comn., 30/10. C. A. Lindup, to Station H.Q., Upavon, 18/11. E. P. Carroll, to No. 6 Sqdn., Middle East, 26/10. R. W. White, to No. 20 Sqdn., India, 8/10. R. L. C. Fisher, M.B., to No. 31 Sqdn., India, 8/10. A. A. Townsend, M.B., to Aircraft Park, India, 8/10. J. A. Quin, M.D., B.A., to No. 25 Sqdn., Hawkinge, 13/11. R. G. J. Charlesworth (Dental), to M.A.E.E., Felixstowe, 26/11. R. E. Edwards (Dental), to R.A.F. Depot, Uxbridge, on appointment to a temp. comn., 8/11.

Flying Officer C. M. Leckie (Dental), to R.A.F. Depot, Uxbridge, on appointment to a temp. comn., 18/10.

STORES BRANCH.—Flight Lieutenants K. D. G. Collier, to Station H.Q., Mount Batten, 16/12. N. Robertson, to No. 100 Sqdn., Bicester, 25/11. G. C. Wilson, to R.A.F. Base, Gosport, 6/12.

Flying Officers A. J. Redman, D.F.C., to No. 602 Sqdn., Glasgow, 14/11. C. S. Whellock, to No. 2 Stores (Ammunition) Depot, Altrincham, 6/11. E. A. Burridge, to R.A.F. Depot, Middle East, 5/11. C. Thripp, H. A. Wrigley and J. S. French, to R.A.F. Depot, Uxbridge, 2/12.

ACCOUNTANT BRANCH.—Flight Lieutenant B. G. Drake, to H.Q., Aden Command, 16/11.

Flying Officer H. D. Conner, to Station H.Q., Northolt, 23/10.

CHAPLAINS BRANCH.—The Rev. J. Lavin, to R.A.F. Depot, Uxbridge, on appointment to a S.S. Comn., 20/11.

An Air Tour of India.

Air Marshal Sir Geoffrey Salmond, K.C.B., K.C.M.G., D.S.O., Air Officer Commanding, R.A.F., India, left Delhi on Nov. 30 on a tour of inspection of aerodromes in India.

The tour will last until about Dec. 19 and the greater part of it will be made by air. Sir Geoffrey Salmond is flying as a passenger in a Service Westland Wapiti and he will be followed by members of his Staff in a Handley Page Hinaidi.

The route of the tour is Jhansi, Saugor, Jubbulpore, Kamptee, Secunderabad, Deccan, Madras, Mandepam.

A few days will be spent at Mandepam from which base flights will be made over Ceylon at the invitation of the Governor.

From there Sir Geoffrey Salmond will fly over Mysore to Bangalore, where he will be the guest of the Maharajah He will then go to Bellary, Poona, Nasirabad, Bikaner and back to Delhi.

The Fairey Long-range Monoplane.

The R.A.F. Fairey (Napier) Long-range monoplane, which flew non-stop from Cranwell to Karachi last April, flew from Northolt to Cranwell on Dec. 3. While the machine was at Northolt, H.R.H. the Prince of Wales made a flight with it.

NEMO ME IMPUNE LACCESSIT.—A Flight of Hawker Horsleys of No. 100 (Bomber) Squadron, R.A.F., coming home to tea. —(*"Aeroplane" photograph.*)

Digitized by Google

An attempt will be made this month to beat the existing World's record for long-distance. The runway at Cranwell which was built to enable this machine to get off with full load, has been extended until it is now well over two miles in length.

The new attempt will be made towards the Cape and the pilots will again be Sq. Ldr. A. G. Jones-Williams, M.C., and Flt. Lt. N. H. Jenkins, O.B.E., D.F.C., D.S.M.

The monoplane has been overhauled since it returned from India and on the next voyage a small wireless transmitting set will be carried and the crew will send out messages notifying their position at four-hourly intervals.

A Fatal Accident.

The Air Ministry regrets to announce that as the result of an accident near Henlow to a Bristol Fighter machine of the Home Aircraft Depot, Henlow Camp, Bedfordshire, on Dec. 3, Flg. Off. Harold Vernon Forbes, the pilot of the aircraft, was dangerously injured and died after admission to sick quarters. Flg. Off. Donald Vernon Ivins, the other occupant of the aircraft, was seriously injured.

At the Inquest at Henlow on Dec. 4, the Coroner said that shortly after 11 o'clock on Tuesday the aeroplane was seen over Clifton flying upside down at about 100 ft. from the ground. It passed over a farm, and Mr. Morris, the farmer, would say that it was going at a moderate speed. Eventually it crashed about 50 yards away in Lime Lane, Clifton. Flg. Off. Forbes died in the Depot hospital.

Flt. Lt. R. J. M. St. Leger, of Henlow, who detailed the machine to the pilot, said it was in a fit and airworthy condition. Flg. Off. Forbes had done 681 flying-hours, and had been in this particular machine before. Flt. Lt. St. Leger could not explain the fact that the machine was flying upside down about 100 ft. above Clifton, and agreed that it would be an unusual procedure.

Fatal Accidents.

In the House of Commons on Nov. 26, in reply to a question by Mr. Hore-Belisha, the Under-Secretary of State for Air said that during the year 1929 there had been twenty-nine fatal accidents in the Royal Air Force involving thirty-nine deaths.

[Mr. Montague's figures include two accidents at Reserve Training Schools involving the deaths of two officers of the R.A.F. Reserve.]

Extensions of Service.

The following officers have been selected for extensions of the active list period of their short-service commissions:—

MEDICAL BRANCH.—(*Extension to five years*): Flt. Lt. J. E. Foran, M.B., Flt. Lt. D. Loughlin.

CHAPLAINS BRANCH.—(*Extension to six years*): The Rev. K. C. H. Warner, D.S.O., M.A.

Long Service and Good Conduct.

The Long Service and Good Conduct Medal has been awarded to the following airmen with effect from the dates mentioned:—

8331 S-M.1. Watson, J. E., 3-10.29; 897 S-M.1. Borrett, W. G., M.M., 19.8.29; 43 S-M.2. Caulfield, M., 26.4.29; 17654 S-M.2. Goodhand, V., 5.8.29; 5778 S-M.2. Mansfield, E. G., 19.9.29; 2023 S-M.2. Rose, L. H., 19.8.29; 315032 F-S. Clarke, A. R., 23.8.28; 314245 F-S. Hill, G. M., 10.8.29; 241437 F-S. Howard, A. W., 7.8.29; 119011 F-S. Jeram, A. B., 1.5.29; 315029 F-S. Lade, G. H., 7.8.29; 144630 F-S. May, S. E., 4.9.29; 313865 F-S. Poile, W., 6.4.29; 313269 F-S. Stonebridge, C., 6.9.28; 11256 F-S. Wheeler, H. J., 28.8.29; 261941 Sjt. Frend, A., 26.4.27; 26150 Cpl. Delaney, A. P., 6.8.29.

A certificate in accordance with para. 251 of K.R. and A.C.I. has been awarded to the undermentioned airman (an ex-Naval rating) with effect from Aug. 7, 1926:—

241437 F-S. Howard, A. W.

The Accountant Branch.

The Air Ministry announces that an examination will be held in the latter part of March, 1930, under the scheme inaugurated in 1924 for the entry into the Accountant Branch of the R.A.F. of qualified and experienced civil accountants. About six vacancies are likely to be available. The age limits are 22 to 26.

The competition will be held in London by the Civil Service Commissioners and will include (1) an examination in book-keeping and accountancy (excluding partnership and executorship accounts), the standard being that of the final examinations of the Institute of Chartered Accountants and the Society of Incorporated Accountants and Auditors; (2) an examination in English and general knowledge (essay, précis and questions to test knowledge of matters of general interest); and (3) an interview before a selection board at which stress will be laid on accounting experience and special weight given to the type of experience provided by articled service.

Application should be made to the Secretary, Air Ministry (S.7), Kingsway, London, W.C.2, for the regulations and for application forms. Completed application forms should reach the Air Ministry by Feb. 1 next or at latest by Feb. 15.

Aircraft Apprentices.

The Civil Service Commissioners announce that open competitive examinations for the entry of (1) aircraft apprentices and (2) apprentice clerks into the R.A.F. will be held in Belfast, Birmingham, Cardiff, Chatham, Edinburgh, London, Plymouth, and Portsmouth, on April 23, 1930.

The limits of age are:—Aircraft apprentices, 15-17, on Aug. 1, 1930; apprentice clerks, 15½-17, on July 1, 1930.

Request for forms of application should be sent to the Secretary, Civil Service Commission, Burlington Gardens, London, W.1.

The Clarke Cheetah.

The draw in the ballot for the Clarke Cheetah has been postponed from the advertised date because some of the Stations have not yet returned their counterfoils. The new date will be announced shortly.

SPORT IN THE R.A.F.

The Rugger Trial.

The R.A.F. final Rugger trial was played at Uxbridge on Dec. 6 and if the results pleased the Selection Committee they were rather depressing to the ordinary spectator.

In the first half the Whites (or Probables) side, led by Flg. Off. G. R. Beamish, lost two unconverted tries to the Colours (or Possibles). In the second half the Whites were stiffened by taking over one or two of the Colours in exchange for lesser Whites, and the Probables, assisted by half a gale behind them, scored two converted and six unconverted tries.

During both halves the Whites got practically every ball out of the scrum but the lack of co-operation among the backs, which is common to all trials of this description, prevented their scoring until the second half was well under way.

The whole game was notable for a complete lack of either individual enterprise or combined effort of an outstanding nature. On the whole the forwards in the Whites side were fairly good but apart from Flg. Off. Beamish the only noticeable forward was Plt. Off. R. W. Letchworth, who was Captain last season of the Cranwell Cadet team which beat both Sandhurst and Woolwich.

Behind the scrum Flg. Off. D. L. Maclean has improved since last year and if he keeps his head may well fill the vacancy caused at scrum-half by the lamented retirement from the Rugger field of Sq. Ldr. Russell. Flg. Off. F. S. Hodder, who played so well for the R.A.F. a few seasons ago and is just back from his overseas tour of service in 'Iraq, put up a very good show on the Whites' left wing. On the few occasions that he was given the ball at all he showed a fine turn of speed, a good swerve and straight running. He scored two beautiful tries in the second half. The other wing-threequarter will probably be Flg. Off. N. E. White.

SINGING IN THE RAIN.—A Flight of Bristol Bulldogs (Bristol Jupiters) of No. 3 (Fighter) Squadron, R.A.F., taking off in wind and rain.—(*"Aeroplane" photograph.*)

who was not playing in this trial possibly because he was playing on the following day in the English trials at Northampton. Plt. Off. J. G. Llewellyn, who was a successful full-back in last year's team, has been moved to inside three-quarter and the place at full-back seems to be very adequately filled by Plt. Off. G. M. Ievers, who was in the Sandhurst XV last year but has since taken a short-service commission in the R.A.F.

None of the Cadets who will pass out of Cranwell this month and will therefore be available for the first match of the R.A.F. representative side were played in this trial.

The trial teams were:—

Whites:—Plt. Off. G. M. Ievers; Flg. Off. J. F. McKenna, Flg. Off. J. R. H. Pott, Plt. Off. J. G. Llewellyn, Flg. Off. F. S. Hodder; Flt. Lt. R. V. M. Odbert, Flg. Off. D. L. MacLean, Plt. Off. G. E. S. Williams, Flg. Off. G. R. Beamish, F-S. Kerby, Flg. Off. J. G. Franks, Flg. Off. J. Beaumont, Sjt. Hall, AC. Maxwell, Plt. Off. G. M. Gillan.

Colours:—Plt. Off. C. M. Rees; Flg. Off. R. R. Nash, AC. Lawson, Plt. Off. B. J. Hurren, Flg. Off. R. D. Cotton, Plt. Off. I. L. S. McNichol; Plt. Off. J. J. Owen; Plt. Off. C. R. Davies, Plt. Off. A. E. V. Mathias, AC. Warren, Cpl. Brereton, Plt. Off. R. W. Letchworth, Flg. Off. J. H. T. Simpson, F-S. Cockle, L-AC. Philip.

Reserves:—Plt. Off. H. G. J. Purcell, L-AC. Blennerhasset, Flg. Off. H. A. Constantine, Flt. Lt. C. D. Adams.—C. M. MCA.

Boxing.

The annual boxing match between the R.A.F. and the Household Brigade was held at Uxbridge on Dec. 5. Fifteen bouts were decided and the result was a draw, each side scoring 22 points.

There were over 1,000 spectators present and the prizes were presented to the winners by Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C., R.A.F. (Retired).

The results in detail were:—

Light-weight.—AC. Varley (R.A.F., Martlesham) beat Drummer Thorne (2nd Batt. S.G.) on points. Varley repeatedly scored with hooks to the head and body.

Middle-weight.—L.-cpl. Stewart (1st S.G.) beat AC. Nee (R.A.F., Tangmere) on points. AC. Nee put up such a game resistance that the referee ordered an extra round, which Stewart easily won with a left to the face. Cpl. Wood (R.A.F., Henlow) beat Gdsm. Cooper (1st G.G.) on points. AC. Collins (R.A.F., Sealand) beat Gdsm. Davies (3rd G.G.) in the first round. Gdsm. Pughe (2nd C.G.) beat L-AC. Clapp (R.A.F., Old Sarum) on points.

Light-heavy-weight.—L.-cpl. O'Grady (2nd G.G.) beat L-AC. Bartlett (R.A.F., Bircham Newton) in the third round. Gdsm. Midgley (C.G.) beat AC. McCann (R.A.F., North Weald) on points. AC. Munkley (R.A.F.) knocked out L.-cpl. Beecham (1st C.G.) in the third round with a right to the jaw.

Welter-weight.—L-AC. Garrett (R.A.F., Manston) beat Gdsm. Duffy (S.G.) on points. Duffy was outclassed and floored twice in the second round from right swings to the jaw. Cpl. Wassell (R.A.F., Catterick) beat Gdsm. Jarman (2nd G.G.) on points. Drummer Woolland (2nd S.G.) beat AC. Foley (R.A.F., Tangmere) on points in a very clever bout. L-AC. Buchanan (R.A.F., Uxbridge) beat L.-Sjt. Hind (2nd C.G.) on points. Sjt. Harper (R.A.F., Henlow) beat Gdsm. Bruce (2nd S.G.) in the third round, the referee intervening after Bruce had been floored from hard rights to the jaw.

Heavy-weight.—Gdsm. Stevens (2nd S.G.) w.o., AC. Woolley (R.A.F.) unfit. Gdsm. Plaice (1st G.G.) beat Flg. Off. G. S. Williams (R.A.F.) Digby) on points.

Six-round Contest.—AC. Hurlehey (R.A.F., Uxbridge) beat L.-Sjt. Smith (R.A.) on points. The bout was the best of the evening. The Artilleryman was punished severely in the fourth and fifth rounds, but came up full of fight for the final round.

The Squash Rackets Championship.

The R.A.F. Squash Rackets Championship was held at Queen's Club on Dec. 3 and 4.

Wing Cdr. F. L. Robinson (holder) won the Championship by beating Flg. Off. F. L. Downing in the final round by three games to nil (9—2, 10—8, 9—3).

In the semi-finals Wing Cdr. Robinson beat Wing Cdr. H. J. F. Hunter by three games to nil, and Flg. Off. Downing beat Sq. Ldr. A. Coningham by three games to one.

AN AIR MINISTRY FOR GREECE.

A report in *The Times* says that a draft Bill has been introduced in the Greek Chamber providing for the formation of an Air Ministry.

The Bill provides that each successive Prime Minister will be *ex officio* Air Minister, and will be assisted by a responsible Under-Secretary and Ministry, who will control military and naval aviation, special attention being paid to the development of civil aviation, for which a separate section will be formed.

TO BE NOTED.

[THE AEROPLANE dated Dec. 25 will contain, as part of the *Aeronautical Engineering Supplement*, an important article by Mr. R. J. Mitchell, designer of the two last Schneider Trophy winners, on "The Effect of High-Speed Flying on Aircraft Design." This article should be of particular interest to all pilots, as well as to all technical readers. Therefore those who want copies should make a special note to order them early, as newsagents are apt to take little interest in ordering technical papers at Christmas-time.—C. G. G.]

DOPED WITH

Saro "Cutty Sark." Two Cirrus Hermes.

CELLON

The dope of proved efficiency

In the Saro "Cutty Sark" Messrs. Saunders-Roe Ltd. have produced an ideal 4-seater cabin flying boat for the private owner. The rudder and elevators are the only portions of the machine which are fabric covered—they are, of course, doped with Cellon. The wings are of plywood and the hull of aluminium-alloy—both are finished with Cerric Cellulose Lacquer, which is specially designed to give complete protection against sea-water corrosion, etc.

Cerric Cellulose Lacquers comply with D.T.D. Specifications for metal parts, cockpits, propellers. Particulars on application.

CELLON, LTD., Upper Ham Road, KINGSTON-ON-THAMES.

AIRCRAFT OPERATION AS IT SHOULD BE.

The Aircraft Operating Co. Ltd. is to be congratulated on having made a contract with the Government of Northern Rhodesia for an air survey covering an area of 63,000 square miles in that Colony.

This stroke of business is directly connected with the recent Colonial Development Act and the Hilton Young Commission, which Commission, in discussing the future of East Africa, insisted on the need for a thorough survey of the topographical resources of any colony before any large schemes were embarked on. The Colonial Development Act authorises work of Empire value to be undertaken with the aid of loans from the British Government spread over a number of years.

Mr. J. H. Thomas, as Minister for Employment, lately made a public reference to the possibilities of air survey as a means of helping Empire development and settlement. On the strength of this Major Hemming, the Managing-Director of the Aircraft Operating Co., with the support of the Governor of Northern Rhodesia, laid before the British Government details of an air survey of a large portion of of Northern Rhodesia which is regarded as a potentially rich copper and mining area.

This scheme was examined by a special committee appointed to examine schemes put forward under the Act and it has now received the requisite Treasury approval.

A specially low quotation was made by the company which, on its experience in air survey, is fully convinced that the key to rapid development of large tracts of the Empire lies first in a general survey from the air. The low quotation was further aided by the fact that the company has now acquired a special type of aircraft—the Gloster Survey biplane—designed to meet its own exacting requirements.

This machine with its high performance, ability to fly on one of its two engines and its very complete photographic equipment should enable the company to do the work at its maximum efficiency. The new Eagle automatic camera and the special photographic equipment developed largely as the result of past experience will further enhance the accuracy of the work and at the same time lead to economy.

The survey will begin next April and in addition to the main area of 63,000 square miles the company will also make aerial plans of the townships of Nkana, Ndola, Nchanga, Luanshya, Mufukira, and Mpika, which additional work will cover an area of 150 square miles.

The Aircraft Operating Co. has already completed a survey in Northern Rhodesia covering an area of 11,000 sq. miles and the new territory to be covered will extend eastward from the earlier survey towards the borders of Portuguese East Africa.

FLYING-BOATS.

In the House of Commons on Dec. 4, Sir G. Dalrymple White asked the Under-Secretary of State for Air whether seeing that Italy had lately ordered three Do.X. flying-boats from Germany, he would say whether it was the intention of the Government to secure one at least of these flying-boats for this country or to build an experimental boat on similar lines here.

Mr. Montague said that the reply to the first part of the question was in the affirmative, but that the Government experimental programme included new types of flying-boats of approximately the same horse-power as the Do.X.

A WARNING ABOUT STREAMERS.

Ground Engineers are warned by Air Ministry Notice No. 24 of this year that the attachment of banners and streamers for advertising or other purposes to aircraft is considered as a modification which affects the safety of the aircraft.

No such banner shall be fitted until approval has been given as required by Paragraph 35 of the Air Navigation Directions 1928 (A.N.D. 7).

AN ALTERATION OF DATE TO BE NOTED.

Owing to urgent circumstances Sir Philip Sassoon has been obliged to change the date of his lecture on "The Third Route" from Saturday, Dec. 14, to Friday, Dec. 20.

The date may actually be more opportune, because people who had arranged to go away for the week-end will now be able to go to the lecture on a week-day. Also a good many young people may be by then down from the Universities or home from school and so may be enabled to go.

Readers should remember that the proceeds of the lecture go to the Royal Northern Hospital, so that besides pleasing themselves they will be helping a good object.

Tickets, price 8s. 6d., 5s. 9d., and 2s. 4d., may be had from the Secretary, 25, Park Lane, London, W.1.

AIR SURVEY ACTIVITY.—An oblique photograph of Rio de Janeiro, made by the Aircraft Operating Co. Ltd.

Digitized by Google

On Saturday, December 7th, gale warnings were issued and, in consequence, all air lines from England to the Continent suspended operations and cross-channel boat services were withdrawn.

A party of four persons had to cross the channel at all costs on that day. Two were private owners of Gipsy Moths and, unpleasant as conditions were, it was decided to fly over. In spite of an adverse 60 m.p.h. gale, terrific bumps and blinding rain, both machines landed successfully at St. Inglevert.

TWO NEW SINGLE-SEAT FIGHTERS.

THE FOKKER D-XVI.—The latest single-seat fighter produced by the Fokker Company. The engine is a supercharged Armstrong Siddeley Jaguar with the Townend cowling-ring.

Hereafter follow descriptions of two very recent single-seat fighters of foreign origin, both with Armstrong Siddeley Jaguar engines.

The Fokker D-XVI is the product of the N. V. Nederlandsche Vliegtuigenfabriek of Amsterdam and the Svenska Jaktfalk has been designed and built by the Svenska Aero A.B. of Stockholm. The machines bear a striking resemblance.

The Fokker D-XVI is interesting in that it departs from the familiar Fokker cantilever wing principle. The wings are braced with rigid bracing-struts as well as cross-bracing wires. Another departure from Fokker practice is oleo springing for the undercarriage.

TYPE.—Single-seat fighter sesquiplane.

WINGS.—Unequal span staggered single-bay sesquiplane. Top wing in one piece carried above fuselage on inverted Vee cabane. Bottom wings, with slight dihedral, attached to bottom longerons of fuselage. One set of "N" type interplane struts on either side of fuselage. One rigid bracing strut from front spar to bottom longeron of fuselage on each side. Wing bays cross-braced with streamline wires. Structure of wood covered partly with plywood and partly with fabric. Narrow chord ailerons on top plane only.

FUSELAGE.—Welded steel tube rectangular structure covered on sides and bottom with fabric and on top with quickly-removable sheet aluminium panels.

TAIL UNIT.—Monoplane type. Welded steel tube framework covered with fabric. Unbalanced surfaces.

UNDERCARRIAGE.—Cross-axle Vee type. Front legs have oleo springing. One diagonal bracing strut between rear legs of Vees. Wheel brakes fitted. Steerable tail skid fitted if desired.

POWER PLANT.—One Armstrong Siddeley Jaguar series B supercharged air-cooled radial engine. Any other air-cooled engine of similar power such as Jupiter, Wasp, Hornet, etc., may be installed. One oval aluminium fuel tank with "Semape" fire-proof cover in behind fire-proof bulkhead with feed by two A.M. pumps to engine. Fuel capacity 71 Imp. gals (320 litres). Oil tank with cooler below and in rear of engine.

ACCOMMODATION.—Pilot's cockpit aft of trailing edge of wing.

DIMENSIONS.—Span 14.4 m. (47 ft. 4 in.), Length 7.3 m. (24 ft.) Height 2.7 m. (8 ft. 10 in), Wing area 18.5 sq m. (199 sq. ft.)

WEIGHTS AND LOADINGS.—Weight empty 920 kgs. (2,024 lbs.), Pilot 85 kgs. (187 lbs.), Fuel and oil 240 kgs. (528 lbs.), Military equipment 145 kgs. (319 lbs.), Weight loaded 1,390 kgs. (3,058 lbs.), Wing loading 75 kgs./sq. m. (15.3 lbs./sq. ft.), Power loading 3.5 kgs./h.p. (7.7 lbs./h.p.).

PERFORMANCE.—No data available.

The Svenska Jaktfalk is the first original single-seat fighter design from the Svenska works. This company builds aircraft under licence from the German Heinkel company, but during the last few years it has produced several aircraft of its own design. Their first aircraft was the Pirat, a two-seat convertible land- or sea-plane designed as an interchangeable advanced training or fighting aircraft. For training it is fitted with the 200 h.p. Armstrong Siddeley Lynx engine and as a fighter it has the 425 h.p. Armstrong Siddeley Jaguar engine.

THE SVENSKA JAKTFALK.—A high performance single-seat fighter, with a geared and supercharged Armstrong Siddeley Jaguar engine, built by the Svenska Aero A.B. of Stockholm.

THE FOKKER D-XVI.—A side view of the latest Fokker military product.

Their second aircraft was the Falken, a two-seat land-plane designed as an interchangeable primary or advanced training biplane with either the 135 h.p. Armstrong Siddeley Mongoose or the 230 h.p. Armstrong Siddeley Lynx engine.

Their third original product is the Jaktfalk, which is illustrated and described herewith.

All these aircraft are built of high grade Swedish steels and timber.

TYPE.—Single-seat fighter biplane.

WINGS.—Unequal span, staggered single-bay biplane. Centre-section carried on splayed-out steel tube struts with one pair of parallel interplane struts on either side of the fuselage. Wing structure consists of two rectangular steel tube spars with either wood or steel ribs, the whole being covered with fabric. Narrow chord ailerons on all four planes.

FUSELAGE.—Rectangular structure of welded steel tube faired to an oval section and covered with fabric.

TAIL UNIT.—Normal monoplane type. Steel-tube framework covered with fabric. All surfaces unbalanced.

UNDERCARRIAGE.—Split type. Consists of two side Vees, the front legs of which incorporate oleo spring, with two bent half-axles hinged to a steel-tube Vee under the fuselage.

POWER PLANT.—One 500 h.p. Armstrong Siddeley supercharged and geared Jaguar engine. Main fuel tanks in the fuselage.

ACCOMMODATION.—Pilot's cockpit behind trailing-edge of wings. Armament consists of two fixed guns in the top cowling and firing through the airscrew.

DIMENSIONS.—Span 9 m. (29 ft. 8 in.), Length 7.1 m. (23 ft. 5 in.), Height 3.46 m. (11 ft. 4 in.), Wing area 22 sq. m. (237 sq. ft.).

WEIGHTS AND LOADINGS.—Weight empty 875 kgs. (1,921 lbs.), Disposable load 500 kgs. (1,100 lbs.), Weight loaded 1,375 kgs. (3,025 lbs.), Wing loading 62 kgs./sq. m. (12.7 lbs./sq. ft.), Power loading 3 kgs./h.p. (6.6 lbs./h.p.).

PERFORMANCE.—Speed at 4,000 m. (13,120 ft.) 320 km.p.h. (196.7 m.p.h.), Landing speed 90 km.p.h (55.8 m.p.h.), Climb to 5,000 m. (16,404 ft.) 9 min., Ceiling 9,500 m. (31,160 ft.).

THE CLERGET DIESEL ENGINE.

Through the courtesy of *L'Aéronautique*, the monthly French technical publication, further details of the new Clerget Diesel engine are now available.

As reported in THE AEROPLANE of Oct. 9, a Morane-Saulnier 120 with the new engine was demonstrated before M. Laurent-Eynac at Villacoublay on Sept. 30.

The new Diesel is a nine-cylinder air-cooled radial and outwardly resembles the famous rotary engines of the same name. A four-stroke constant volume cycle is employed. The cylinders are of steel with separate aluminium heads.

There are two valves per cylinder, one an air inlet and the other an exhaust valve. The injection mechanism is placed in the middle of the cylinder head. It comprises an atomising device. The pumps appear to be located at the back of the engine.

The weight per h.p. is stated to be about 2 kgs. (4½ lbs.).

THE SVENSKA JAKTFALK.—A side view of the single-seat fighter produced by the Svenska Aero A.B. of Stockholm.

NATIONAL FLYING SERVICES

The Badge of Service and what it stands for

THE Badge of the N.F.S. organisation is the badge of an all round service for civil flying. Wherever you may be, or whatever you may want in connection with flying, you are assured of prompt, expert, and economical service by this badge. You may want to learn to fly, or to hire a machine; you may want to buy an aeroplane of your own and to have it insured, housed, and properly maintained; you may want a ground engineer's examination; a weather report, or a map; it is all one to N.F.S. They exist to serve you.

THE TWO LATEST AMERICAN FOKKER MONOPLANES.

THE FOKKER F-32.—A three-quarter front view of the 30-passenger monoplane produced by the American Fokker Company.

The Fokker Aircraft Corporation has recently produced two new types of aircraft, the F-32 four-engined thirty-two seat monoplane, and the F-14 single-engined mailplane.

The first F-32 has flown successfully, but this machine has been destroyed by fire after a crash during a test flight. A second machine is approaching completion, and preparations are being made to lay down five more to fill an order from Western Air Express. These are to be used on a service between San Francisco and Los Angeles.

It is further reported that five have been ordered by the Universal Aviation Corporation for use on its trans-Continental services.

The F-32 follows Fokker practice very largely, but the provision of four engines, together with their disposition in tandem pairs on either side of the fuselage below the wings, has produced new designs for engine mountings, undercarriage and tail unit. Nevertheless, even to the most unpractised eye, there could be no doubt about its ancestry.

The accommodation of the F-32 provides for the carriage of 30 passengers in four compartments, but it can also be supplied as a sleeper, for night-flying, with the cabin transformed into eight sections accommodating sixteen berths, eight upper and eight lower.

SPECIFICATION.

TYPE.—Four-engined commercial transport monoplane.

WING.—Cantilever monoplane tapering in chord and thickness mounted directly on top of the fuselage. Wing in two sections with joint on centre-line. Built-up of two tapered box-spars and plywood ribs, the whole covered with plywood. Maximum depth of spars at centre 44 in. "Frise" type ailerons.

FUSELAGE.—Rectangular welded mild carbon steel tube structure covered with fabric. Cabin floor, corrugated duralumin sheet and plywood, supported by rivetted aluminium transverse girders. Internal bracing of cabin section arranged to leave clear a central aisle.

TAIL UNIT.—Monoplane type with twin rudders mounted above tailplane. Frame, steel tube held by pyramidal bracing to fuselage. Balanced elevators and rudders.

UNDERCARRIAGE.—Divided type. Each unit on oleo leg attached to middle of side engine nacelle with built-up girder radius-rod running aft to nacelle at a point just ahead of rear engine.

Wheel axle of 4 in. tube, hinged to underside of fuselage at a point midway between the longeron and centre-line. Universal joints of inner end of axle and top end of radius rod are ball and socket type.

Bendix wheels and wheel brakes fitted. Tyres 58 in. by 14 in. Wheel brake drum size, 20 in. by 2 in. Wheels on Timken roller bearings.

Tail-wheel mounted on special welded steel tube fork with normal rotation of 30 degrees. An automatic release actuated by a sudden abnormal side-load permits complete rotation in emergency. A hand release is provided when complete rotation is desired for handling by ground crew.

Main wheels and tail wheel provided with fairings of corrugated duralumin carried on a light steel tube structure.

POWER PLANT.—Four 525 h.p. Pratt and Whitney Hornet air-cooled radial engines mounted in tandem pairs one on each side of fuselage below wing. Engine mountings of welded steel tube suspended from wing spars by triangulated system of steel tube. Main fuel tanks in wings above engine nacelles. Double oil tank between engines. Front engines have two-bladed and rear engines three-bladed Standard Steel airscrews. Electric inertia starter with engine-driven generator on each front engine.

ACCOMMODATION.—Enclosed pilot's cockpit seating two side-by-side with dual control in front of wing. Baggage compartment below and in front of pilot's cockpit with capacity of 100 cub. ft. Baggage compartment also below pilot's cockpit. Behind cockpit is forward passenger compartment 6 ft. long by 5 ft. 9 in. wide by 7 ft. 7 in. high. Second compartment 6 ft. 11 in. long by 8 ft. 1[illegible] in. wide by 7 ft. 5 in. high. Thereafter follow two pantries or galleys one on each side of a passage way, which connects with the third passenger compartment, which is 6 ft. 8 in. long by 8 ft. 7 in. wide by 8 ft. 1 in. high. The fourth compartment is 6 ft. 8 in. long by 8 ft. 3 in. wide by 7 ft. 8¼ in. high.

Behind this last compartment is the entrance lobby with two doors, one on either side of the fuselage. Behind this lobby are two lavatories.

For day flying passengers are seated in pairs on each side of a central passage-way. Cabin heating from the exhaust, ventilation by special adjustable ventilators and cabin cockpit navigation and landing lighting are fitted. Pressure fire-extinguishers and landing flares can be installed.

DIMENSIONS.—Span 99 ft. (30.17 m.). Length 69 ft. 10 in. (21.28 m.). Height 16 ft. 6 in. (5.03 m.). Wing area 1,350 sq. ft. (125 sq. m.).

WEIGHTS AND LOADINGS.—Weight empty 14,200 lbs. (6,350 kgs.). Crew 340 lbs. (154 kgs.). Fuel and oil 2,700 lbs. (1,225 kgs.). Pay load 5,260 lbs. (2,380 kgs.). Weight loaded 22,500 lbs. (10,200 kgs.). Wing loading 17.92 lbs./sq. ft. (87.5 kgs./sq. m.). Power loading 10.73 lbs./h.p. (4.87 kgs./h.p.).

No official performance figures are yet available, but in test flights by Lieut. Johnson, of the U.S. Air Corps Test Branch, at Wright Field, Dayton, Ohio, it was claimed that a top speed of 157 m.p.h. (253 km.hr.), with a cruising speed of 120-125 m.p.h. (193-200 km.hr.) and a landing speed of 47 m.p.h. (75.6 km.hr.) was made. What load was carried is not known.

The F-32 was designed to have a top speed of 140 m.p.h. (225 km.hr.), a cruising speed of 120 m.p.h. (193 km.hr.), and a landing speed of 60 m.p.h. (96.6 km.hr.).

THE FOKKER F-14.—The latest version of the Fokker Super-Universal (Pratt and Whitney Hornet engine).

Various claims, which have the air of being highly imaginative, have been made for this machine. One says that with two-thirds load it would hold its flying speed and even *climb* on *one* engine.

Out of respect for what appears to be a very fine product of a company which should be well versed in the requirements of commercial aviation all further claims as to its performance will be ignored until officially-observed figures are issued.

The Fokker F-14.

The Fokker F-14 has been produced as a high-speed mail-carrying monoplane and is a modification of the Fokker Super-Universal. It differs from that type in that the monoplane wing has been raised above the fuselage on short struts, the pilot's cockpit has been moved from the front to aft of the cabin and it may be fitted with either a 525 h.p. Pratt and Whitney Hornet or a Wright Cyclone.

An order for six F-14's has been received from Western Air Express, and a further order for ten has been received from Western Canada Airways.

Although designed primarily for mail transportation without seats, the cabin may be fitted with six comfortable seats. It has a maximum pay load of one ton. Preliminary tests show the F-14 to have a maximum speed of 140 m.p.h. (225 km.hr.), a cruising speed of 115 m.p.h. (185 km.hr.), and a landing speed of 55 m.p.h. (88.5 km.hr.). The initial rate of climb is 1,200 feet (about 350 m.) per min., the service ceiling is 18,000 ft. (about 5,500 m.), and the cruising range of 800 miles (about 1,300 km.).

THE LATEST PRATT AND WHITNEY ENGINE.

The Pratt and Whitney Aircraft Co. of Hartford, Connecticut, has produced a 300 h.p. nine-cylinder radial air-cooled engine to be known as the Wasp Junior.

The new engine incorporates all the features of the same company's Wasp and Hornet engines, and by standardisation of design 80 per cent. of the parts of the Wasp Junior are interchangeable with those of the Wasp and Hornet.

The Wasp Junior uses so many of the standard parts of an already well-tried engine, that none of the difficulties usually encountered with the production of a new engine type were experienced by the company, and extensive preliminary tests have been very satisfactory.

It is an interesting fact that the use of Wasp parts has not made the Junior unduly heavy for its performance. The standard Wasp rear crankcase section is used, so that either engine may be mounted on the same engine-bearers.

As with the Wasp and Hornet, the Wasp Junior may be supplied with or without an airscrew reduction gear.

In order to provide a comparison, the specifications of both the 450 h.p. Wasp Series "C" and the 300 h.p. Wasp Junior are given below:—

	WASP JUNIOR	WASP SERIES "C."
Bore	5 3/16 ins.	5 3/8 ins
Stroke:	5 3/16 ins.	5 3/8 ins.
Weight (direct drive):	550 lbs.	690 lbs.
Output:	300 H.P. at 2,000 r.p.m.	450 H.P. at 2,100 r.p.m.
Fuel consumption:	0.55 lbs. per H.P./hr.	0.55 lbs. per H.P./hr.
Oil consumption:	0.025 lbs. per H.P./hr.	0.035 lbs. per H.P./hr
Overall length:	41 3/32 ins.	42 9/16 ins.
Overall diameter:	45 3/4 ins.	51 1/2 ins
Weight per H.P.:	1.83 lbs.	1.53 lbs.

During 1929 the Pratt and Whitney Aircraft Company has produced an average of 200 Wasp and Hornet engines a month, as compared with 65 engines a month in 1928.

The total mileage of Pratt and Whitney engines flown daily on regularly operated transport lines carrying passengers, mail, and express, approximates 68,000 miles. This is an interesting figure when it is realised that only 91,000 miles are scheduled to be flown daily by regular operators.

WASP AND WASP JUNIOR.—Front views of the standard Pratt and Whitney Wasp and the new Wasp Junior. The Wasp has a commercial rating of 420 h.p. at 2,000 r.p.m. and weighs 775 lbs. The Wasp Junior has a commercial rating of 300 h.p. at 2,000 r.p.m. and weighs 550 lbs.

THE ALBERT A.20.

One of the results of M. Laurent Eynac's reorganisation f the French Aircraft Industry has been the ordering of pecial multi-engined aircraft from various firms. These nachines are intended in the first place for service on air nail routes and also for passenger carrying.

One of the first of these to be produced is the twin-ngined Albert A.20 monoplane, which has been designed nd built by Avions Albert, Rue du Petit-Drancy, Drancy Seine). No performance figures are yet available, but re-orts in the French technical press state the trial flights ıave been very satisfactory.

YPE.—Twin-engined postal monoplane.

/ING.—High wing cantilever monoplane. The wing section is bicon-vex but not symmetrical. The wing tapers in chord and thickness to the wing tips. The decrease in thickness is all on the top of the wing, the underside remaining quite level. The wing has a multiple spar structure. These spars are of the box type with spruce flanges and plywood webs. The wing is entirely covered with plywood of varying thickness. The ailerons are of high aspect-ratio and unbalanced. They extend from the fuselage almost to the wing tips and are operated by push-pull tubes.

'USELAGE.—Square section with blunt nose and tapering to vertical edge at fin-post. Four longerons and usual struts, the whole covered with plywood. Specially strengthened frames at attachments for wing and undercarriage.

'AIL UNIT.—Normal monoplane type. Adjustable tail-plane let into the fuselage. The one-piece elevator passes across the end of the fuselage aft of the fin-post. Elevator controls of the rigid type. Vertical fin is fixed. Rudder controls are double cables. Neither the rudder or elevator are balanced. The whole tail unit is built of wood, including the covering.

JNDERCARRIAGE.—Divided type with wide track 3.18 m. (10 ft. 5½ in.). Each half consists of a Vee hinged to the lower fuselage longeron with a long spring strut to the upper longeron. The shock absorber is of the Messier oleo-pneumatic type. Wheel brakes are fitted. The tail-skid is a double leaf-spring.

POWER PLANT.—Two 60 h.p. Walter five-cylinder radial engines are mounted in nacelles projecting slightly below and forward of the wing, one on each side of the fuselage. Sufficient fuel for 900 kms. (560 miles) is carried in the wings. The oil tanks are behind the engines. The nacelles are covered with detachable aluminium panels. Each has starters and fire-extinguishers.

ACCOMMODATION.—Pilot's cockpit completely enclosed beneath leading edge of wing. Two side-by-side seats. The side panels of the wind-screen can be opened. Behind the pilot is a small cabin for freight or two passengers. Window on port side, door on starboard.

DIMENSIONS.—Span 15 m. (49 ft. 2½ in.), Maximum chord 2.10 m. (6 ft. 11 in.), Length 8.97 m. (29 ft. 5 in.), Height 2.90 m. (9 ft. 6½ in.), Wing area 25 sq. m. (269 sq. ft.).

WEIGHTS AND LOADINGS.—Weight empty 835 kgs. (1,844 lbs.), Disposable load 420 kgs. (926 lbs.), Weight loaded 1,255 kgs. (2,770 lbs.), Wing loading 50 kgs./sq. m. (10.25 lbs./sq. ft.), Power loading 10.45 kgs./h.p. (23.1 lbs./h.p.).

PERFORMANCE. (Estimated).—Speed, maximum, 175 km.hr. (109 m.p.h.), Speed, landing, 70 km.hr. (43.5 m.p.h.), Ceiling 5,000 m. (16,800 ft.), Range 900 kms. (560 miles).

IBIS AIRCRAFT.

For some time the fact that Sq. Ldr. Bert Hinkler, with the assistance of Mr. R. H. Bound, late of A. V. Roe and Co. Ltd. and the Hampshire Aeroplane Club, was building an aeroplane of his own conception and design somewhere in the purlieus of Southampton has been an open secret.

This little conspiracy is at present known as Ibis Aircraft of Hamble, Southampton.

The machine now being built will be a two-seat cabin amphibian to be known as the Ibis. An appropriate name, seeing that the Sacred Ibis is a bird which frequents water and that *ibis* means "thou goest."

It has been designed by Sq. Ldr. Hinkler from experience gained in his numerous big flights all over the World in light aeroplanes. And the Ibis is intended to overcome the limitations of the existing types of light landplane for variegated touring. The designers intend that it shall be able to go anywhere without causing the pilot any anxiety about the possibility of forced landings or of having to find an aerodrome at the end of a day's flying.

It will be a thick-wing cantilever monoplane the wing of which will incorporate the rigid internal bracing developed and patented by Mr. Basil Henderson of the Hendy Aircraft Co. Ltd. of Shoreham, Sussex. This construction was first described in THE AEROPLANE of Nov. 27.

The hull will have an enclosed cabin for two, with side-by-side seating ahead of the wing, which will give an unobstructed view in practically all directions. The cabin has been designed to provide the same comfort that one expects in the best saloon automobile, and it will be noteworthy for the absence of the usual control shafts and levers which complicate the existing type of cockpit.

No petrol will be carried in the hull, so the occupants may smoke with safety. And a remarkable amount of luggage space will be provided,—which will allow of really bulky baggage being stowed away with ease.

Two 40 h.p. Salmson AD-9 air-cooled radial engines in tandem will be fitted above the wing, and the arrangement of the power-plant ensures that the engines will run under ideal conditions.

The designers claim that the Ibis will fly on one engine, and with both engines running each will be well throttled down to minimise wear and tear, and, in addition, to enable them to function most economically.

The Ibis will have a span of 38 ft., the chord of the wing will vary from 6 ft. 3 in. at the root to 4 ft. ½ in. at the tip, and the total wing area will be 180 sq. ft.

The total weight of the machine will be 1,355 lbs.

The appearance of the Ibis will be awaited with considerable interest.

Sq. Ldr. Hinkler has often expressed a desire to produce a machine to fulfil his own requirements for aerial touring. That the results of his last big flight to Australia, in which he demonstrated the capabilities of the existing type of light aeroplane for really serious long distance flying, should have enabled him to put his theories into practice is highly satisfactory.

A more practical pilot, who is capable of translating his own brilliant ideas into something concrete, would be hard to find anywhere in the World. Any standard type of machine flown by Sq. Ldr. Hinkler for any length of time has always come to be fitted with gadgets of his own conception. His Avian which he flew to Australia was a typical example of this.

Hitherto he has had to be content with the flying of standard type aircraft. But his work with these has given sufficient indication that a machine of his own design should be well worth the consideration of all who are interested in real aerial touring.—L. B.

VICKERS
(AVIATION) LIMITED

ACCESSORIES for AIRCRAFT.

Enquiries of Aircraft Constructors and Users are invited for the following specialities manufactured by VICKERS (AVIATION) LIMITED and used largely in aircraft supplied to the Royal Air Force:—

VICKERS (Patent) FUEL COCKS (Light Pattern).

VICKERS FUEL PUMPS (Hand-operated & Wind-driven).

FOOT VALVES. NON-RETURN VALVES. FUEL FILTERS.

RELIEF VALVES. FLOW INDICATORS. OIL COCKS.

VICKERS-DAVIS NAVIGATION LAMPS (Light Pattern).

GENERATING EQUIPMENT FOR AIRCRAFT LIGHTING.

VICKERS-REID CONTROL INDICATOR.

VICKERS-POTTS OIL COOLERS.

VICKERS OLEO-PNEUMATIC UNDERCARRIAGE AND TAIL SKID SHOCK ABSORBING UNITS.

VICKERS UNIVERSAL PULLEYS & GUARDS FOR LIGHT CONTROLS.

STREAMLINE WIRES AND SWAGED TIERODS.

"MALLEVILLE" ADJUSTABLE PIPE CLIPS.

VICKERS (Patent) HYDRAULIC BRAKES.

Head Office:

VICKERS HOUSE,
BROADWAY, LONDON, S.W.1.

Telephone: VICTORIA 6900.

Works: **WEYBRIDGE, SURREY.**

Telegrams: VICKERS, SOWEST, LONDON

THE LIGHT AEROPLANE
AND THE FLYING CLUBS.

FRENCH PRIVATE FLYING.

BY A. H. Y. ALI.

Frenchmen will tell you that there is no private flying in France:—"*L'Aviation de Tourisme? Ca n'existe pas.*" Which is nearly true. And the chief reason for this confronts one at the very airport of Paris; for the whole of one side of Le Bourget aerodrome is given over to a military flying depot, the frontage of whose buildings is as great as, if not greater than, that of the civil establishment opposite. What we may call the "Arc de Triomphe" complex, indeed, is hindering their progress in many other matters besides this one of private flying.

In spite of their large Civil Aviation Vote (the figures for 1928 were approximately £1,750,000 as compared with Great Britain's £415,000), they allocate none to the subsidising of Light Aeroplane Clubs, which in general are found to be unable to pay their way without some sort of assistance from the Government. So that, even were there a large demand for the services of such clubs, questions of finance would effectually prevent their flourishing.

But, owing to the conscription system and the *bourseries* for the *Armée de l'Air*, most of the youths who are keen to fly can learn to do so as part of their training, and after their period of service is over can put in a certain number of hours' flying a year at Government expense. Thus there is not the same demand for the light aeroplane and its works as there is amongst the youth of England.

True, in their very handsome "*Annuaire de l'Aéronautique*" one will find quite a long list of "flying clubs": but many of these are little more than an upper room over a barn. Even over here Clubs are not quite unknown where the activities of most of the members are limited to the wearing of a tie. In France the flying man is still regarded as something of a phenomenon: it is therefore regarded as rather *chic* to be one, or nearly one.

Again, the French, as they will all tell you, are not travellers. The idea apparently is that as they have made their country the world's playground it is rather pointless to leave it for any other.

These, then, are some of the reasons underlying the backwardness of France in private flying as compared with Germany and England. Her light aeroplane industry, as one would expect from what has been said before, is not yet out of the experimental stage. The firms that are producing light aeroplanes at all are each responsible for a bewildering number of distinct types, which rapidly give way to new ones.

This, of course, is the way of evolution in every field. It will not be until the public demand is more clearly defined that one will be able to look to each firm for the production of its own particular type of machine.

I visited the works of two of the leading light aeroplane manufacturers—those of Morane-Saulnier at Puteaux and of Caudron at Issy-les-Moulineaux.

The former had no real light aeroplanes in their shops, either completed or under construction. They are occupied practically entirely with military training machines (chiefly high-wing monoplanes of medium power) and single-seater fighters. If you wish to purchase one of their so-called *avions de tourisme* (type 147, high-wing monoplane, engine Salmson 120 h.p.), it will cost you the equivalent of over £1,000. [Since Mr. Ali was in France the Morane firm have undertaken the making of Moths.—ED.]

The Caudron activities are very much more interesting from the point of view of the private flyer. Considering the lack of encouragement for the light aeroplane, their progress and the low cost of their machines are surprising.

At present they make three general types of *avionette*, particulars of which are given below:—

Type C.109. High-wing monoplane.—C.109, Single-seater, 40 h.p. Salmson (approx.), £500; C.117, Two-seater, 65 h.p. Salmson, £570.

Type C.190. Low-wing monoplane.—C.192, Two-seater, 95 h.p. Salmson, £650; C.193, Two-seater, 80 h.p. Renault, £460.

Type C.161. Biplane, with folding wings.—C.161, Two-seater, 65 h.p. Salmson, £540.

The low-wing monoplane is a particularly neat-looking machine with very wide undercarriage, and somewhat reminiscent of the Klemm. It is covered throughout with three-ply: its maximum ground-speed is about 103 m.p.h. It will be interesting to see what success it achieves on the market.

RESPONSIBILITIES AND POSSIBILITIES.

About the only people to cross the Channel on Saturday, when all the steam-boat services and air-line services were cancelled seem to have been four aviators.

On Saturday morning Mr. and Mrs. Alan Butler, in Gipsy-Moth G-AACL, and Mr. and Mrs. Nigel Norman, in Gipsy-Moth, G-AAHI, took off from Lympne and landed at St. Inglevert. Mr. Butler and Mr. Norman had urgent appointments in Paris, and as there were no other means available they chose the way of the air. Presumably, Mrs. Butler and Mrs. Norman went because they were determined, in a very proper spirit, to share the success or disaster of their husbands.

This is one of those performances which leave the serious supporter of aviation mentally sunk. Here you have two men, each with great business responsibilities, taking what seem to be immense risks purely as a matter of sport. So what is one to say about them?

Mr. Butler is the Chairman of the De Havilland Company, and although he is a young man he has a peculiarly active and far-seeing mind. Undoubtedly the De Havilland Company would survive without him. But at the same time Mr. Butler certainly has been very largely responsible, quite apart from his financial backing of the company, for its enterprising and far-sighted policy,—so he could not lightly be spared.

Similarly, Mr. Muntz would probably carry on the Heston Air Park quite ably without Mr. Norman. But Heston and Mr. Muntz without him would be rather like Swan without Edgar or Debenham without Freebody or perhaps Arding without Hobbs.

Therefore the question arises whether men who not only have great responsibilities, but who are brilliant and young and obviously have still greater possibilities, ought to take risks of such a sort no matter how great the results at issue. At any rate, neither of them would have been financially ruined if they had not crossed the Channel on Saturday.

On the other hand, there is no getting away from the fact that their combined flight was a magnificent sporting effort. Sport necessarily entails risk. If there is no risk there is no sport. And a gamble with human life is the greatest of all gambles.

Apart from that, the fact that they alone crossed the Channel on that day is in its way a wonderful advertisement for air transport as such.

Still, on the whole, one's personal feelings are best summed up in the old Cockney phrase, "they hadn't oughter done it."—C. G. G.

A FRENCH LIGHT AEROPLANE.—The Caudron C-117 two-seat monoplane (65 h.p. Salmson engine), which sells in France for £570.

THE FLYING CLUBS.

In the House of Commons, on December 4, in reply to Mr. Everard, the Under-Secretary of State for Air supplied the following information regarding the subsidised flying clubs. The name of the Club is followed by the year and the amount paid in subsidy for the completed year:—

1. Hampshire, 1927, £3,020; 1928, £1,150; 1929, £2,000.
2. Lancashire, 1927, £1,220; 1928, £1,513 15s.; 1929, £1,655 10s.
3. London, 1927, £1,280; 1928, £1,844 11s.; 1929, £2,000.
4. Midland, 1927, £580; 1928, £955 3s. 6d.; 1929, £1,874 11s.
5. Newcastle-upon-Tyne, 1927, £1,150; 1928, £1,332 12s. 6d.; 1929, £1,273.
6. Yorkshire, 1927, £955; 1928, £814; 1929, £1,184 17s. 6d.
7. Bristol and Wessex, 1928, £916 17s. 6d.; 1929, £1,091 5s.
8. Norfolk and Norwich, 1928, £1,021 15s.; 1929, £788 7s. 6d.
9. Nottingham, 1928, £685 4s.; 1929, £557 5s.
10. Scottish, 1928, £1,587 2s. 6d.; 1929, £774 12s. 6d.
11. Cinque Ports, 1929, £797 12s. 6d..
12. Liverpool and District, 1929, £1,529 12s. 6d.
13. Suffolk and Eastern Counties, 1928, £500.

The Club year for the clubs numbered 1 to 6 ends on July 31, for those numbered 7 to 9 on Oct. 31, for number 10 on Nov. 30, for number 11 on Mar. 31, for number 12 on Aug. 31, and for number 13 on Dec. 31. The clubs numbered 7 to 10 have been in receipt of subsidy for two years only and those numbered 11 to 13 have completed only one year under the subsidy agreement.

Mr. Everard asked the Under-Secretary of State for Air the names of the light aeroplane clubs in existence in this country; and the number of machines in use by each club.

Mr. Montague gave the following list of the light aeroplane clubs and the number of aircraft owned by each club and said that in addition there were aircraft privately owned by members in use at the clubs, but he had no information in regard to their number:

Subsidised Clubs: London, 6; Midland, 3; Lancashire, 4; Yorkshire, 3; Newcastle-upon-Tyne, 3; Hampshire, 4; Bristol and Wessex, 4; Norfolk and Norwich, 3; Nottingham, 2; Scottish, 4; Suffolk and Eastern Counties, 5; Cinque Ports, 3; Liverpool and District, 4.

Unsubsidised Clubs: Northamptonshire, 3; Southern, 1; Leicestershire, 1; Berks, Bucks and Oxon, Nil; Household Brigade Flying Club, 1; Derby and District, Nil; Southport, Nil; Flying Club of Ulster, Nil.

Service Clubs: Halton, 2; Royal Aircraft Establishment (Farnborough), 2; Marine Aircraft Experimental Establishment (Felixstowe), Nil.

In addition, 27 aircraft are shown by the Air Ministry Register to be owned by National Flying Services Limited.

THROTTLE CONTROL.

In the last issue of THE AEROPLANE a reference to Mr. Tuckett's mishap at Alexandria appeared. The accident was ascribed "to some trouble with the throttle control."

So far as is known, nobody has ever had trouble with the throttle control of a Moth, at any rate while flying, for the control mechanism is simple, direct and robust. "Trouble with the throttle control" would not be so very funny in the air, and the average person may justifiably think that if the control can give trouble on the ground, it is equally likely to do so in the air, so this affair needs explaining.

In point of fact, a letter has been received by the De Havilland Co. from Mr. Tuckett explaining exactly what did happen. Mr. Tuckett himself was not concerned, except in an abortive effort to avert disaster. Apparently three mechanics together caused the trouble, each acting unbeknown to the other two. "A" opened the throttle wide and left it there, "B" removed the cap carrying the ignition switch earth-lead from one of the magneto contact-breakers, and "C" obligingly swung the prop. The engine, being a Gipsy, started.

Mr. Tuckett, who was some yards off, courageously leapt for the cockpit, got knocked over backwards onto his head and passed out for a quarter of an hour. After which, one hopes, he addressed the mechanics adequately. If this sort of thing is going to happen the Air Ministry will have to consider issuing a Grade B.F. Certificate for Ground Engineers.

MOTHS IN FRANCE

The French journal *Les Ailes* has been publishing in the form of interviews the experiences of various French private owners.

The last two interviews have been with M. Costa de Beauregard and M. André Jamain, both of whom are owners of Gipsy-Moths.

M. Costa de Beauregard bought a second-hand Cirrus-Moth in 1928 and in August of this year he sold it for very little less than he gave for it and bought a new Gipsy-Moth. He speaks highly of his two mounts, the upkeep of which have cost less than that of an automobile.

M. André Jamain has three aircraft, of which one is a new Gipsy-Moth. Speaking of this machine, M. Jamain said that "it was only necessary for me to buy a Gipsy-Moth in England to understand why that country is the only one that truly indulges in *le tourisme aérien*."

When he was asked whether the Moth fully pleased him, he replied:

"As it pleases everyone who tries it. A small hangar is all that is necessary; I am my own mechanic—if one can say that—as I have never touched anything."

"A spin of the airscrew and one is away. On return one folds the wings and that is all. The machine is ready for the next outing. 850 kilometres' range, 145 km.p.h. cruising speed with a consumption—at this speed—of 20 to 22 litres of petrol and a third of a litre of mineral oil; no mechanical anxiety; absolute cleanliness, an ideal pilotage—always. What a dream!"

A very gracious and unsolicited testimonial.

AUSTRALIAN CLUB ENTERPRISE.

Nine aero clubs have been formed in country districts in New South Wales under the ægis of the Aero Club of New South Wales, which has its headquarters in Sydney. The parent club, which is in a very flourishing condition and must be the biggest flying club in the British Empire, will control the flying activities of these subsidiary clubs.

These clubs are at Goulburn, Newcastle, Crookwell, Ballina, Lismore, Coff's District, Cessnock, Narromine, and Parkes.

The Goulburn Club was formed 18 months ago, has two Gipsy-Moths and 300 members. The president, Mr. F. W. Scholz, presented the first machine to the Club, and three Club-trained pilots have bought their own machines. The instructor is Mr. B. W. Duley, late R.A.F. The Club has its own aerodrome three or four miles from Goulburn, on which there is a shed and petrol supplies.

The Newcastle Club was formed 12 months ago but has been held up in its flying activities owing to the lack of an aerodrome. A landing ground is now being laid out and when it is ready a machine will be bought and instruction will begin.

The Crookwell Aero Club was formed fifteen months ago with the sole idea of maintaining a landing ground. This is now a regular calling place for aircraft passing through the district. The parent club holds a pageant there every year. The membership is between 150 and 200.

The Ballina Aero Club was formed six months ago to maintain the existing landing ground at that place. Arrangements are to be made for training pilots and the erection of a shed later on.

The Lismore Aero Club has a membership of from 100 to 150 and the efforts of the members has resulted in the

local Council raising a special loan of £5,000 to buy an aerodrome. This is the first municipality to raise funds for this purpose in N.S.W.

The Coff's District Aero Club has been formed as the result of the parent club holding a pageant there last January, and the local Council has been persuaded to prepare a landing ground which is now nearing completion.

The Cessnock Aero Club was formed two months ago and it is negotiating for the purchase of 80 acres from the State Government to make a landing ground. If successful a shed will be built and training of pilots undertaken.

The Narromine Aero Club has been organised by Mr. H. Bowden Fletcher, late R.A.F., and is already in possession of a first-class landing ground. It is considering the formation of a flying section and nearly half of the present membership of 40 is on the waiting list for training.

The Central Western Aero Club at Parkes was formed 12 months ago and has a membership of from 150 to 200. It intends to take over the existing civil aerodrome and to erect a shed thereon. It will later undertake flying instruction.

THE ANNUAL DINNER OF THE HAMPSHIRE CLUB.

The fourth annual dinner of the Hampshire Light Aeroplane Club was held at the South-Western Hotel on Dec. 6. There were about 150 people to dinner.

Lord Apsley, D.S.O., M.C., who is a vice-president of the Club, was in the chair, and in the absence of Lady Apsley, the Lady Mayoress of Southampton received the guests.

Another vice-president of the Club, the Rev. Bruce Cornford, proposed the toast of "The Club."

He said that they had four machines—two Moths, an Avian, and a Spartan—which had already flown this year a total of over 1,600 hrs. as compared with the 1,568 hrs. of all last year.

The membership of the Club was 420 and over 100 held pilot's licences. 35 members had been trained this year and 80 were now under instruction.

Last July the Club completed its first year under the new Government subsidy scheme and received the maximum grant of £2,000. No other club had managed to do this in its first year.

Sq. Ldr. Bert Hinkler replied to this speech and said a number of nice things. He thought the Club would shortly be providing facilities for touring, which was the ideal way of spending a holiday.

Lt.-Col. Darby proposed "British Aviation," and referred to the pioneering efforts of Sir Alliott Verdon Roe (who was present) and to the fine flights of Mr. Stack who flew to India and back, of Sq. Ldr. Bert Hinkler, who flew to Australia, and of Lt. Bentley who had made a habit of flying to and from Africa.

Sir Sefton Brancker replied to the toast. He said the Hampshire Club had upset the Air Estimates, as £1,200 was calculated to be the most that the Air Ministry would have to pay to any club.

He found there was a general atmosphere of pessimism on the Civil side of Aviation. In civil aviation to-day, there was quality but not quantity. This was due to lack of money [No! It is due to lack of enterprise.—C. G. G.]

Britain was the first nation to create an Air Ministry and an Air Force, and was the first country to make an unbroken flight across the Atlantic, both in lighter-than-air or heavier-than-air machines.

We made the first and quickest flight to Australia. We won the last two Schneider Contests and broke the Speed Record on both occasions. We were the first country to establish a regular commercial air service.

We had produced the first heavy-oil-driven airship in the World. Above all we were the first people to build a really practical light aeroplane and to establish a system of light aeroplane clubs.

The Director of Civil Aviation urged the associated clubs to co-operate and produce a concrete scheme to enable them to carry on when financial help from the Air Ministry ceased.

Civil Aviation was costing the Taxpayer half-a-million this year and it was worth every penny of it. British Aviation was all right, and had pilots, designers, materials, everything except money—and even a little more of that might be forthcoming.

The Mayor of Southampton said that negotiations were proceeding for the acquisition of 100 acres of land at Swaythling for use as a municipal air-park. The site was quite close to the railway and had been approved by the Air Ministry.

Southampton hoped to have the aerodrome before the Club's next dinner. They also hoped that in time the airport would become the most important in the country as the seaport was. He thought that the shipping and aircraft companies would largely co-operate in their mutual interests.

After this there was a highly successful dance.

THE LONDON AEROPLANE CLUB PARTY.

Seldom can there have been a more successful party than the dinner and dance given by the London Aeroplane Club at the Park Lane Hotel on Dec. 4. There were between 350 and 400 people present, and if any one of them failed to enjoy him or herself it was certainly not the Club's fault.

The dinner was excellently done and the floor of the Park Lane ballroom is as good as the very best in London. The band was quite good, even if there are some better. By way of giving the more energetic dancers a rest there was a perfectly amazing conjuror and thought reader, quite the best man of his kind one has ever seen. Also, there was a cabaret show.

The only speech was made by Mr. Wills. It had nothing whatever to do with the proceedings, but was extraordinarily funny. When the band left, some time after 02.00 hours, everybody was sorry, which is the best evidence of the success of any party.—C. G. G.

A NOTION TO BE IMITATED.

The London Aeroplane Club have started a scheme which ought to be imitated at once by all other clubs and by flying schools as well. In future all pupils under instruction flying solo will carry streamers on the rudders of their machines. Thus other pilots in the air will be able to spot at once a machine flown by a novice and will be able to give it a wide berth in their own and the pupil's interest.

Nothing scares a pupil so much as having another machine flying anywhere near him when he is in the early stages of solo flying. Also, a solo pupil is likely to concentrate so intensely on getting his machine down into the aerodrome that he is quite likely not to see anything else in the air. Consequently another pilot, who expects him to give way according to the rule of the road, may find himself in a collision, or at any rate may have to save himself at the last moment after having shaken the pupil's nerves.

LONDON—NAIROBI.

On Sept. 21 Mr. F. A. Swoffer, late Instructor to the Hampshire Aeroplane Club, left London in a Gipsy-Moth VP-KAC, to fly to Nairobi, for duty with Wilson Airways Ltd., which company he has recently joined.

The delay in recording this flight is entirely due to Mr. Swoffer's reticence and dislike of publicity. His departure from England was unknown to all except a few friends, and the first reference of any length to the flight in the Press was made in East Africa after his arrival. Which is so unlike those people who are profusely photographed before starting, and never get anywhere, or who do nothing when they get somewhere.

On arrival at Paris his machine was rammed by another Moth, which delayed his progress for six days. He continued eventually to Lyons, Hyères and along the Riviera to Pisa and Rome.

From Rome he went by way of Naples (where he shed his passenger) to Catania and over the Mediterranean to Tunis.

From Tunis he continued to Gabes, where he was delayed owing to his arrival at "siesta" time, Tripoli, where he missed the aerodrome, which was half flooded by a neighbouring reservoir, and on to Benghazi, Sollum, and thence to Alexandria and Cairo.

Here he was met by the R.A.F. Reception Flight, who replaced a broken valve spring and gave him every possible attention.

From Cairo he flew to Assiut, Aswan, Wadi Halfa and Atbara.

His arrival at Atbara was unnoticed by anybody, and after waiting at the aerodrome for three-quarters of an hour he flew over the town in the hope of attracting attention. This was unsuccessful, so he taxied his Moth up the main street and succeeded in attracting the desired attention.

His Moth then took him to Khartum. Thence he went to Malakal, where the aerodrome was found to be big but mostly covered with grass six or seven feet high, and Mongalla. Between Malakal and Mongalla he was told to follow the telegraph line, but this was impracticable, as the posts were painted black and quite indistinguishable from the surrounding bush. In some places the poles were shorter than the grass in which they stood.

On Oct. 21 he flew to Jinja and thence to Nairobi, where he arrived just at nightfall.

He covered the distance of 6,000 miles in 78 flying hours. His equipment behaved perfectly, and except twice the weather was ideal.

THE INDIAN FLYING CLUBS.

During August the four Indian Flying Clubs at Calcutta (Bengal), Bombay, Delhi and Karachi, flew a total of 275 hours 34 mins. of which 185 hrs. 35 mins. was instructional flying.

The total flying time for 1929 up to Aug. 31, is 2,436 hrs. 50 mins., of which the Bengal Club has flown 677 hrs. 5 mins., the Bombay Club 475 hrs. 35 mins., the Delhi Club 374 hrs. 50 mins., and the Karachi Club 909 hrs. 20 mins.

Active steps are being taken to form Clubs in Lahore and Madras. The Club in Lahore is to be called the Punjab Flying Club and it has been registered as a limited liability company.

In both Lahore and Madras provisional executive committees have been appointed and each has enrolled over 100 members.

The formation of these Clubs is dependent on the grant of an annual subsidy and a grant to cover the cost of the initial equipment from the Government, and if granted, this subsidy will begin on April 1, 1930.

A.A. FLYING MAPS.

The Automobile Association desires to draw the attention of their members to a correction of the current 1 in. Ordnance Survey Civil Air Edition, Sheet 12. The position of the forbidden area at Chatham has recently been altered, and a new edition is in hand.

Members who desire to have their A.A. General Service Flying Maps brought up to date, are invited to send them to the Automobile Association.

THE AERIAL BEAGLES.

A feminine reader of THE AEROPLANE in Northampton, Miss Olney, has graciously sent the following graphic and amusing account of the meet at Sywell, which was illustrated last week:—

Saturday, Nov. 30, marked a new epoch in Flying and Hunting Circles, when Mr. Noel Lloyd, Master of the Pipewell Foot Beagles, and the Committee of the Northamptonshire Aero Club arranged the first Aerial Beagle Meet at Sywell.

Truly the Clerk of the Weather must be a good sportsman for Saturday was delightfully mild and fine, after days of almost torrential rain. The Meet was arranged for 2 o'clock, but visiting pilots were asked to arrive by 12.30, and an informal lunch was held in one of the hangars.

The flying visitors were:—Sir Sefton Brancker, piloted by Sq. Ldr. Leslie (the latter walked with a decided limp, the result of a recent hunting accident); Flt. Lt. T. Rose (of the Anglo-American Co.); Mr. Jackaman; Mr. Cazalet; Flt. Lt. and Mrs. Bentley (in their Moth "Dorys," of England—South Africa fame); Mr. McClure, of the A.A.; The Hon. R. and Mrs. Westenra (from Teignmouth in his and her own Moths, Mrs. Westenra's piloted by Mr. Parkhouse); three Avians from Norwich, piloted by Messrs. Brett, Cubitt and Surtees, the latter with Mr. Ford; Mr. Ruthrees, who flew a Brooklands School plane with Mr. Innes as passenger.

For some reason the Press took great interest in the venture, and reporters of various daily and weekly papers were much in evidence as well as film operators.

The beagles arrived about 1.15 and the camera people got busy posing the pack against a background of aeroplanes. In the meantime the Skywell Beagles arrived from the air.

Four planes suddenly appeared—from the leader dropped a toy hare suspended to a parachute, and from the others toy dogs chased the hare, also by parachute. The hare and most of the dogs fell right in front of the cameras, and much curiosity was aroused among the real Pipewell Beagles.

When the planes landed the huntsmen jumped out attired in true sky-beagling fashion, sky-blue coats, white breeches and caps, and ties of the Aero Club colours. The huntsmen were Messrs. A. J. and G. Linnell, B. Olney, P. Tysack, T. Rose, H. Brown and E. Kew.

The beagles first drew Sywell Spinney, and were almost at once in luck, for two or three hares were set moving. The first hare was soon killed, but hare number two gave an excellent run—choosing the wettest ploughed fields wherever possible. The heavy going and the hot pace soon caused the field to string out, but among those gamely following to the end were Sir Sefton Brancker, Mr. Bentley and Mrs. Westenra.

Others there were who with much difficulty trudged across the first ploughed field, and thereafter decided that beagling by air was an easier game. The stragglers were much helped by this, as the movements of the planes showed the direction taken by the beagles.

Most of the pilots stayed the night in Northampton. In the evening there was the usual dinner, when beside the usual speeches and toasts, Mr. Bentley and Flt. Lt. Rose sang the Club song—a new version of "John Peel."

The last verse of this song refers to the late Lieut. Rhodes Moorhouse, V.C., R.F.C., the first Northamptonshire private owner, who flew to Northampton and landed on the Race Course in 1912.

The end of the evening appears to have been quite as cheery as on former occasions and everyone voted the whole show a great success which they hoped might be repeated in the future.

THE BOURNEMOUTH YOUNG AIRMEN'S LEAGUE.

A party of the Bournemouth Young Airmen's League visited the Hampshire Aeroplane Club on Nov. 30 at the invitation of the Secretary, Mr. H. J. Harrington, and were given free flights in the Club aircraft.

The League has been formed by Mr. W. C. Longman, formerly of the R.A.F., and Mr. H. Weller, who was a mechanic in the R.F.C.

The Air Ministry has given the organisation the fuselage and wings of a Woodcock, and Sir B. G. Elliott has given them a 100 h.p. Anzani and a 160 h.p. Beardmore engine.

The members of the League learn how an aeroplane is built and how it can be handled on the ground.

MORE FOREIGN ORDERS.

The De Havilland Aircraft Co. Ltd. has received orders for Gipsy-Moths from Rumania, Norway and Denmark in the past month. The value of the orders is about £6,000.

Rumania and Norway are the two latest countries to employ Moths as training machines for military purposes. Denmark has already had a number of Moths for this purpose, so this is a repeat order.

The Roumanian Air Force is buying three wooden machines. The Norwegian Ministry of Defence is buying three metal machines, and the Royal Danish Air Force has bought two metal machines. All three orders are for landplanes.

CIVIL AIRCRAFT IN NEW ZEALAND.

The most recent register of Civil Aircraft in New Zealand shows that twenty-five aircraft have been allotted registration lettering.

All the twenty-five are light aircraft belonging largely to the Light Aeroplane Clubs.

Nineteen are D.H. Moths, three are Avro-Avians, two are Simmonds Spartans and one a Blackburn Bluebird. Of the two Spartans one was to have been flown from England to New Zealand by a Mr. H. F. Mase early this year, but it was crashed in France and got no further.

Of the civil aircraft actually operating in New Zealand therefore, approximately 80 per cent. are D.H. Moths.

THE LATEST TAUBE.

The first Etrich-Taube was flown in 1909 and during the early days of the War 1914-18 the name became well known.

Herr Igo Etrich, who is a linen manufacturer at Trautenau in Czechoslovakia, and who designed the old Taubes, has recently built a new Taube. It is a two-seat cabin monoplane of the braced high-wing type.

The wing is of the familiar Taube form and has a single bracing strut on each side.

The fuselage is very deep, with the two seats in tandem one behind the other. Large unglazed apertures cut in the sides take the place of windows. There is however a windscreen from the top of the fuselage to the top of the wing. This appears to be for upward rather than forward vision which is obtained from the side windows.

The tail unit is of the familiar Taube arrow shape.

The undercarriage is a one-piece axle passing through the fuselage and sprung by rubber rings.

The engine is a 40 h.p. Salmson with the two lower cylinders completely enclosed in the fuselage.

The machine has the following dimensions:—Span of 11 m. (36 ft. 1 in.), Length 6 m. (19 ft. 8 in.), Height 1.8 m. (5 ft. 11 in.), Wing Area 15 sq. m. (162 sq. ft.). The Weight loaded is 300 kgs. (660 lbs.) with a range of 800 kms. (497 miles). The maximum speed is 150 km./hr. (93 m.p.h.), and the landing speed is 50 km./hr. (32 m.p.h.).

CHRISTMAS PRESENTS.

There are still ten or eleven days in which to buy Christmas presents, so those who have not obeyed the behest to "Shop Early" had better start now.

Of course, the ideal present for a friend connected with aviation would be an Argosy or a Calcutta or a Supermarine, with a capital sum for its maintenance,—but such things are only possible to fortunate people like the Guinnesses and the Basses and the Worthingtons. There may also be some lucky people who can reasonably expect such presents as Moths and Avians and Desoutters and Spartans and Bluebirds from their rich relations, but even they are comparatively few and far between.

More reasonable presents are such things as aviators' helmets, gloves, leather coats and so forth, which can be bought from D. Lewis of 124 Gt. Portland Street, London, W.1, and from S. Lewis's, 19 and 27, Carburton Street, London, W.1, and from Wainwright's, 300-2, Euston Road, London, N.W.1.

Goggles of the most *de luxe* kind, with optical lenses, can be got from E. B. Meyrowitz, in Bond Street.

Those who can afford something even more expensive will find that various useful accessories for aircraft themselves, such as Hughes' compasses and such of Smiths' instruments as are not standard fittings in aircraft, are very much appreciated by their friends who own aircraft.

Another gift of the more expensive kind which will be much appreciated by any owner of an aircraft or even by anybody who is in the habit of travelling in aircraft is the Williamson Pistol Camera. Or a parachute from Russell's or Irving's would be gratefully received.

Coming down to lesser things, Skinner & Co., of 34, Old Bond Street, W.1, have a very fine assortment of jewellery, especially brooches, pins and so forth with R.A.F. badges and Squadron crests. And the cigarette box which the firm have recently put on the market with the striking picture of the Schneider Trophy winner on it is bound to be acceptable.

A great many people like aeroplane mascots for their cars and metal models of aeroplanes for desk ornaments and paper-weights. These are made with full knowledge of the craft by the Birmingham Medal Co. of Summerhill Terrace, Birmingham, and A. E. Lejeune Ltd., of 132 Great Portland Street, W.1.

Then there are the various books catalogued in the list which may be had post free from THE AEROPLANE BOOK DEPT., Cannon House, Pilgrim Street, E.C.4.—And these include "All the World's Aircraft of 1929"—price £2 2 0—which will be ready on Dec. 16.

Among all this lot everybody concerned with aviation ought to be able to find something to please his or her aeronautical friends.

SCOTS WHA HA'E!?

Is there really a brave man in Scotland who is still flying a Sopwith Camel as a peace machine? *The Sunday Pictorial* of Dec. 8, 1929, has quite a handsome picture under the heading, "Over the Lowlands whitened by early snow," and over the description "An aeroplane flight over the Lowlands of Scotland, on which can be seen a thin coating of early snow. Picture by Captain Alfred G. Buckham." The picture shows an unmistakable Camel over scenery which might certainly be in the Lowlands of Scotland. Perhaps the Scottish Flying Club will enlighten us. And after all, it may be the early snow of the Winter of 1918-19, or even earlier.

THE GLIDING MOVEMENT.

THE GLIDING LUNCH.

The Gliding Lunch was held at the Comedy Restaurant, Panton Street, on Dec. 4. A measure of the enthusiasm for the movement may be gauged by the number of people, who managed, in the middle of the day in the middle of a working week, to devote two hours or more to a function of this kind. The organisers had more or less arranged for thirty people to turn up, and thought they were being optimistic. Actually about sixty sat down, and some were rather squashed.

Mr. Douglas Culver who originated the idea of the lunch was in the chair. Mr. Culver learned to fly at the Grahame-White School, at Hendon, in 1916, and later became an instructor there. In August, 1918, he was shot down behind the German Lines, and was taken prisoner, in which process he lost his arm. Having only one hand he says that he cannot handle a throttle-lever *and* a control-stick, so he opines that he will do best in a glider, with control-stick only.

After lunch Mr. Culver began the proceedings by saying what a surprise it was to see so many people. He originally had visualised about fifteen. Many of those present had come a long way and he thought this was all to the good, because his general scheme was that a Home Counties Gliding Group should be formed for London and the surrounding parts. Meanwhile other groups should be formed over the country, and after two or three months' experimental working these groups might send delegates who would confer with the Home Counties Group.

Mr. Dagnall of the R.F.D. Company then offered most generously to place part of his Works at the disposal of such a Club and to build one or two gliders free of cost. The members however must co-operate and supply the designs, for he could not do this. Later on Mr. Dagnall offered to buy a German Glider for the Club, if nobody in this country felt like designing one.

Col. the Master of Sempill complimented Mr. Culver on thinking of the lunch and getting all the people together, and The Aeroplane on the support it had given to Mr. Culver.

He said that he knew personally that considerable funds would be forthcoming to back such a movement, if those who began it showed energy and enthusiasm. He also knew that Mr. Wimperis, the Director of Scientific Research at the Air Ministry, was very interested in the movement and was anxious to help it.

The Royal Aeronautical Society had arranged for Dr. Georgii, Head of the Engineering Dept. of Darmstadt University, to give a lecture on Gliding before the Society on Feb. 20, 1930. With Dr. Georgii will be the Head of the Wasserkuppe Gliding School. The Society hope to arrange an informal lunch or dinner in connection with this lecture. He thought if those interested could find some likely sites before the lecture, Dr. Georgii could be taken to see them and could give an opinion on their suitability.

Col. Sempill suggested that a central organisation should be formed which other provincial clubs might copy later on. He pointed out that a certain amount of technical supervision had been found necessary in Germany as at the start there had been some bad accidents.

He said that the Royal Aeronautical Society were very anxious to do all they could to help the scientific side of the movement, but he reminded us that the Royal Aero Club was supreme in all matters of aerial sport.

Mr. Bramson asked whether towing gliders behind aeroplanes came within the scope of the proposed Club. He thought that as such flights could be made in still air such gliding would be valuable for scientific purposes.

Mr. Lowe Wylde explained that he had done a little gliding. He thought that there was enough technical skill in this country to design and build a glider without going to Germany. It would be a great thing to start right away so that when Dr. Georgii did come over we should have had some experience and could therefore get greater good from the lecture.

Mr. Blyth said that he did not know very much about gliding except that he had been to the Wasserkuppe and only an accident to the Darmstadt glider had prevented him from making a trip in it. He thought people would be disappointed in gliding as a sport unless they realised that team work was required and that the individual would be lucky if he got one flight a month.

Towing behind an aeroplane was only an adjunct to gliding. Hills at least 800 ft. high should be used if gliders were to reach the first cloud layer where cloud-soaring might be practised. The cotton-wool type of cloud seen on Summer days were the best sort of formation for cloud-soaring.

Mr. C. M. Newton, Chairman of the Northamptonshire Aero Club, said that a section of his Club were keen on gliding. There were those who wanted to glide and those whose wives would not let them fly and who thought that gliding might be the thin end of the wedge. His Committee was prepared to back such a movement.

Mr. Jeyes, who piloted an Aachen glider at the Itford Meeting in 1922, and is now a member of the Northamptonshire Aero Club, explained how the light aeroplane had been developed from the gliders of the Itford Meeting and how this development had stopped the development of the glider.

As team-work was essential, a club with committee and chairman must be formed. He thought that the aircraft firms might be prepared to subscribe towards such a club. This club must be formed right away so that all those present at the lunch should have a chance of keeping together.

Flt. Lt. C. Crawford, who built his own light aeroplane and its engine while stationed in 'Iraq, said that flying was his profession but that he looked upon gliding as a cheap form of sport. He also regarded it as a way of raising the enthusiasm of the younger generation for flying. The boys of the neighbourhood would form a very convenient source of labour to any club.

He thought that the Club should prepare good drawings of a simple form of glider, which would be available for all members,—who could then build their own glider. He had seen gliding done in Switzerland from a level plain and this was quite good enough for preliminary training. The Swiss Gliding Club were prepared to let him have drawings and specification of their glider. He was prepared to form a gliding club at Eastchurch.

Another speaker suggested that a provisional committee should be formed on which the provincial areas should be represented.

Mr. Whidborne suggested that The Aeroplane might put forward names for the Committee which might be approved at the next conference.

Mr. Grey said he thought that it would be better if those who would be prepared to serve on such a committee gave their names to Mr. Culver.

After a kind of general conversation, in which everybody just avoided talking together at once, a provisional committee slowly arose from primeval chaos and held its first meeting amid the wreckage of the feast.

The Committee consists of Mr. Culver (Chairman), Mr. Latimer Needham (Halton), Mr. Lowe Wylde (Kent), Mr. Lander (Northumberland), the Viscount Carlow (London), Mr. Whidborne (London), Mr. Wroughton (Croydon), and Mr. Ashwell-Cooke (Cinque Ports).

Mr. L. Howard Flanders is Honorary Secretary and the temporary address of the British Gliding Association is by courtesy of the Society, c/o The Royal Aeronautical Society, 7, Albemarle Street, London, W.1.

The Committee will shortly hold another meeting, after which the structure, subscriptions and so on of the new association will be announced. Meanwhile letters should be addressed to Mr. Flanders at the above address.—T. J.

[There is interest in noting that apparently gliding is beneath the notice of the Royal Aero Club, in these days of its affluence, for, although several of those present at the lunch were ordinary members of the Club, no personage of importance in the Governing Body of the Sport of Flying thought that the occasion was worthy of his august presence.—C. G. G.]

ON LEGALISING GLIDING.

Before the embryonic British National Gliding Association, or British Gliding Club, or whatever it is going to call itself, goes very far, those who are so sportingly concerning themselves with its formation ought to discover precisely what is going to be the attitude of the Government towards gliding. Apparently gliders come under the Air Navigation Act and have to be certified as airworthy. And presumably places from which gliding is to be done ought, on the same analogy, to be certified as aerodromes for the purposes of gliding.

If something of this sort is not done the young sportsman who builds his own glider may find himself liable for prosecution for using it more than three miles away from a recognised aerodrome, for flying an unlicensed aircraft, and for being an unlicensed pilot in charge of an unlicensed aircraft flying more than three miles from a licensed aerodrome.

As the Law stands at present all kinds of funny things may crop up. An aircraft which has not been certified as airworthy may be flown experimentally within three miles of a recognised aerodrome, and it may be flown by a man who has not qualified for his Pilot's Certificate. Therefore, a glider being an aeroplane within the meaning of the Act, an un-airworthy glider with an un-certified pilot may be towed over the ground from a recognised aerodrome, either by manual and pedal labour, or by an automobile, or even by another aeroplane, so long as it does not go outside the three-mile limit.

But you may have the position of a glider certified as airworthy flown by a fully certificated aviator, coming under the heavy hand of the Law because it is flown down a hillside which could never be certified as an aerodrome unless the Air Ministry is going to grant special certificates for gliding and soaring aerodromes.

The question must also be raised as to whether every glider in process of construction will have to be inspected by the Aeronautical Inspection Department. This also will have to be considered by the Air Ministry.

Strictly according to the Law the drawings of every glider ought to be inspected and passed by the technical experts at the Air Ministry, and the fee for such inspection and certification would probably be about £25. After that according to the Law, every succeeding Certificate of Airworthiness for other machines of the same type built according to those same drawings will cost £5 a time.

Some of us were discussing these points after the gliding lunch the other day when Mr. C. M. Newton, of Northamp-

ton, brightly remarked that he supposed that the A.I.D. would accept the force of gravity as motive power without it having to pass a type-test or to be certified as airworthy. Evidently Mr. Newton's mind throws back to his famous namesake, or perhaps ancestor, who is alleged to have invented gravity. But the question only shows how the strict letter of a Law may operate.

Sir Sefton Brancker and all the scientific people at the Air Ministry are sure to do everything they can to simplify the regulations governing gliding, but after all the Law is the Law and they are Government officials and must interpret the Law as it stands. So the sooner these points are cleared up the better.—C. G. G.

KITED GLIDING.

One of the gliding people who have recently written to THE AEROPLANE has been making progressive experiments with model gliders flown as kites. His letter is published below. His chief trouble appears to be a sudden change of wind direction while the glider is on the ground.

I am writing this in the hope that you will publish it for the sake of obtaining other glider enthusiasts' views as to the feasibility of the form of gliding which I advocate. Had I the time and the money I would put the matter to practical test forthwith.

Put shortly, my idea is this. The orthodox method of gliding (or for the matter of that soaring, and incidentally our word "soaring" seems perfectly adequate and most appropriate to describe what the Germans call "wind-sailing") is to drag the glider to the top of a suitable slope, take off and either, with luck, soar about (as described in your issue of the 6th, and as demonstrated at Itford and in Germany) or descend to the bottom again. In the latter event the time taken to get the machine back to the starting point is out of all proportion to the time spent in the air.

Now there is no earthly reason why, with a properly designed glider, one should not take off on perfectly level ground and rise to any desired height above the starting point within certain limits while the glider remains captive, in other words, while flying like a kite.

The obvious advantages of this method are that flying could be carried on almost continuously, so long as a stiff enough breeze was blowing, machines casting off the mooring cable when a good height had been reached and thereafter taking advantage if they could of whatever rising currents there happened to be, to remain aloft or climb higher. Under favourable conditions it would be possible to remain up a very considerable time. No time would be lost getting the machine to the top of a hill, and moreover, it would provide a means of gliding in flat country where no suitable hills are available.

The advantage of a hill lies solely in its power to produce up-currents, but up-currents are by no means confined to air over irregularities of surface contour, but (as you have pointed out in your issue of the 13th) may be produced by clouds. There is another factor (probably there are several in addition to this) which causes up-currents and that is the *colour* of the ground. Dark ground such as ploughed land absorbs more heat than, say, grass land. Therefore, over certain portions of a ploughed field there are likely to be rising currents particularly after the sun has been shining on the ground.

As to the mooring cable, steel stranded cable of sufficient strength to take the pull due to the head resistance of a normal glider weighs surprisingly little per 1,000 ft., for instance 5/32 in. cable weighs 5½ lbs. per 1,000 ft. and has a breaking strain of 370 lbs. Now, if we allow that the head resistance of a glider is about 1/6th of its loaded weight, and assuming a head resistance of 150 lbs., giving a factor of safety of about 2½ on the aforementioned cable, we could use it for a machine having a loaded weight of 900 lbs.

If the machine is a single-seater and 170 lbs. is allowed for the pilot, the machine itself should not weigh anything like the difference, i.e., 730 lbs. Something in the neighbourhood of 300 lbs. would be a more reasonable weight to assume for the machine, giving a loaded weight of 470 and a head resistance of 78 lbs. approximately, or a factor of safety on the above cable of about 4¾ which would be ample because if a spring balance were attached to the cable connector on the machine and placed where the pilot could read it, he could voluntarily control the tension at all times.

One thousand feet of cable would enable a vertical height of, say, 500 ft. to be attained at a very conservative estimate. As a matter of fact this only means an angle of 30 degs. between the mooring point and the machine. Actually, if the head resistance of the machine is only 1/6th of the loaded weight it ought to be theoretically possible to increase the angle to about 80 degs., which would mean a maximum height of 980 ft. with 1,000 ft. of cable, as a reference to a sine table will verify.

There is only one difficulty which my experiments with models has brought to light and that is that, since the wind tends to veer from moment to moment, when the machine is on the ground it is absolutely essential that it should have some adequate means of moving crab-wise so that it can always keep head to wind.

Naturally, the further the machine from the mooring point the greater the arc which is swept in this veering process, therefore it seems that it is preferable to pay out the cable as the machine rises rather than have a great length of it laid out flat on the ground before the machine takes off.

Whether a full-size machine would tend to drift in this way as much as a model is doubtful because it is reasonable to suppose that the variations in direction of the main body of the wind is less than the variations in directions in internal eddies and therefore the larger the span of the machine the less the latter variations will affect it.

It seems that for this particular method of taking off, that is to say without an initial run but simply waiting for a strong enough gust to raise the machine from the ground, what is required is a special form of undercarriage. Castor wheels are not a satisfactory solution but my most recent experiments have been directed to finding some satisfactory alternative. The moment is scarcely ripe to disclose designs but I believe that I am on the right track.

It may interest you to know that I have got models onto and off the ground without mishap and without any aid other than the wind, ascent and descent being, of course in an arc of radius equal to the length of the mooring cable, that is, to all intents and purposes vertical when near the ground, and there is something extremely fascinating and graceful in the sight as the machine lightly lifts off and is soaring up, and as lightly floats down to earth again as the wind drops.

My models all have non-lifting tails, a good dihedral and aspect ratio, with the centre of gravity kept pretty low down so that they have a considerable amount of inherent stability.

No doubt a machine with a pilot in it could be kept even steadier than these models manage to keep themselves without any external control, but they have convinced me that, given a suitable undercarriage the method is quite practicable.

HOW GLIDING IS DONE IN AMERICA.

The Wright Aeronautical Corporation, who are famous as the builders of the Wright Whirlwind engine, have taken a founder's membership in the National Glider Association (of America). The Wright Corporation is offering for three consecutive years $1,000 (over £200) for prizes in gliding.

MORE FIREWORKS.

On Oct. 22, at Düsseldorf, further experiments were made with a rocket-propelled glider.

Herr Espenlaub, who is well known as a designer of gliders and for his successful demonstrations of tow-gliding behind aeroplanes, was the pilot. The glider was towed into the air, and the towing-rope dropped. The first rocket was fired, and is said, rather ambiguously, to have thrown the glider upwards into the air.

The glider caught fire, and Herr Espenlaub, being an Elijah, brought his fiery chariot to the ground—instead of continuing his celestial journey. He was unhurt, and will repeat the venture.

THE BLERIOT FILM.

On December 4 a select party of guests were invited by Mr. Alexander Duckham to the little Edi-Bell Cinema Theatre to see the film of M. Blériot's Twenty-Five Years of Aviation. The film deals entirely with M. Blériot's individual activities, but as M. Blériot is one of the World's great pioneers, and has made an immense amount of aeronautical history and is still in the forefront of the World's aircraft constructors while still himself an active pilot, no other individual, except perhaps Mr. Henry Farman, or Mr. Glenn Curtiss, could be the subject of such a film.

The pictures begin with M. Bleriot's first experiments with a towed glider, cover his early experiments in France, his flight, for the first time in History, across the Channel, the first looping of the loop by M. Pégoud, the first launching from and alighting on a wire without touching the ground, also by Pégoud, the various Blériot war products and the latest Blériot activities.

This film has been shown once before in England at the Royal Society of Arts, when M. Blériot was here celebrating the twentieth anniversary of his crossing the Channel. One hopes most sincerely that other opportunities will be given for other people to see the film on this side of the Channel.

One does not know whether the film shown is the only copy in existence. If it is it should certainly be copied so that it can be exhibited in places which are primarily concerned with aviation, such as R.A.F. Establishments and our public schools. It is most valuable history.

Mr. Alexander Duckham is a very old friend of M. Blériot, hence his being able to get the loan of such a precious film.

Mr. Duckham's connection with aviation began with his pioneer work in connection with lubricating oil, and that pioneer work has been followed up to such good effect that to-day the Air Ministry approve the methods in the Duckham Works to such an extent that the firm is allowed to despatch oil to R.A.F. Stations without the usual prior inspection by the Air Ministry.

When you consider that not only the life of the engine but the life of the crew of an aeroplane may depend on the quality of oil used, the importance of this trust may be realised.

The story of the oil and how it is produced, and the way to use oil intelligently in an engine, is told in a little book called "Technical Talks," which can be had post free from Alexander Duckham and Co. Ltd., at 6, Broad Street Place, E.C.2. The book is illustrated by Mr. Heath Robinson, most irreverently, considering the status and importance of the firm and the quality of its products, but more funnily than anything he has done for a long time.—C. G. G.

WANTED FOR CANADA.

A representative of a prosperous Canadian aircraft operating firm who is returning to Canada on Dec. 27, wants to get in touch with a pilot, who would like a job in Canada and can go at once. Preferably the applicant should be an ex-N.C.O., unmarried and with at least 500 hours' flying. Seaplane experience is desirable.

COMMERCIAL AERONAUTICS.

AMERICAN AIRPORTS.

By An American Pilot.

The Aeroplane published lately a picture of the Chicago airport. I have had considerable experience operating on this airport.

While the run-ways shown are long and quite wide, they are absolutely the only place you can taxi an airplane, and if the wind happens to be on a run-way running say parallel to the hangars shown in the pictures, it is necessary to taxi out and back on the cross-wind run-way. This is no easy job in a single-engined airplane in a good strong cross wind. Even with the use of brakes it results in the wearing out of one brake very rapidly, trying to hold the machine on a straight course.

Also, even though these runways are good and wide, there is not too much room for two ships to pass each other. This is even more true in the case of taxying out on a runway that is to be used for landing. If runways are to be used, some system must be worked out whereby there are separate runways for taxying and landing.

In regard to night operations. Several weeks ago I flew to Chicago at night. The entire route is lit by beacons which are about twenty miles apart. I started out with about a thousand foot ceiling slightly overcast. About half-way it started to sleet and snow, and I was down to about seven-hundred feet. At this altitude and under these conditions the beacons were entirely too far apart, particularly as all the lights in the ship went out and I had quite a little difficulty in keeping the course from one beacon to another before I could see it.

Then, when I arrived at Chicago, I spent three-quarters of an hour over the city trying to find the airport.

There were beacons in all directions. Everybody that builds a new hotel or an extra high apartment house puts a beacon on top of it for advertising purposes. I knew there was a large gas-tank by the Chicago Airport and hoped to locate it by this tank. I found three gas-tanks all lit up like Christmas-trees, all with beacons beside them but no airport. Finally I found a fourth tank, which was not lit as much as the other three.

There was a beacon fairly near it; and after flying around for about ten minutes I decided that what looked like a maze of streets underneath was undoubtedly the run-ways of the Chicago Airport. I had been led to believe it was completely lit for night flying.

The run-ways were all outlined in white lights, and once I landed it was impossible to see where the cross run-way began that was to take me to the hangars. The result was that I got off the runway and got stuck in a ditch, without any damage to the ship, but it necessitated my walking about a mile in the pouring rain to get help, as nobody seemed to pay any attention to the landing. I admit I had no lights at all, and probably nobody ever saw me.

On inquiring about the flood-lights which I had thought the airport was equipped with, I found out that they are not used on rainy nights because they result in the pilot levelling off at about thirty feet owing to a kind of ground mist that is always present in a rainstorm. As a result, they stated that they turned on the lights when they heard a plane overhead or saw its lights to give the pilot the location of the airport; and when he came in to land they turned them off again.

The night I arrived nobody saw me at all.

There is a new system that is just being tried out over here, where lights are imbedded in the ground down the middle of the runway under a heavy glass which is practically unbreakable. These lights are of a green colour and are apparently very easy to land by. They are connected by an electrical connection to a wind-tee, so that the lights are always shown on the run-way that is into the wind. There is an arrow-point at the end showing the direction one should come in.

These lights are to be placed exactly twenty feet apart, so that a pilot coming into a strange airport by counting the lights will be able to find out how long the runway is. The system sounds very good, but so far has only been placed at one airport,—which apparently is not used much.

I am afraid that over here the title "airport engineer" has been rather misused. There are literally hundreds of concerns who claim to specialise in the building of airports, and in most instances know nothing whatsoever about it.

While on the subject, another fault with runways is that in nine cases out of ten they seem to be a little off the wind direction. It may be true that the prevailing wind in England is from the West, but it certainly is not true of the Eastern United States. During about three months of the year, December, January, and February, and part of March, as a rule the prevailing wind is from the West, but the rest of the time it is liable to be anywhere and changes very suddenly and frequently. Many times on a two-hundred mile flight I have had the wind change at right angles two or three times.

Major Cordes, of the Handley Page Company, who is over here with their Guggenheim entry, was remarking on this the other day, as just fooling around one's own airport one always has to keep one's eye on the wind sock. I have seen many near accidents due to pilots who had only taken off fifteen or twenty minutes before, coming in the same way they had taken off, and nearly crashing into someone who was coming in correctly on the wind.

It is going to be very hard, as flying becomes more common, to get private owners, in particular, to obey rules which must necessarily be obeyed. The Department of Commerce has some very excellent rules over here, but there is very seldom much attention paid to them. And I must say that in order to work the subject out properly, a great deal of thought must yet be given to it.

If two ships are coming into a properly regulated airport close to each other, but do not see each other, as is very possible, how on earth is the man in the signal tower, who is supposed to signal them in, going to convey his signal to the proper one?

The only hope that I can see is that in general people seem to be fairly intelligent. And in the course of time the second or third generation of pilots will acquire a sort of sixth sense, and in that way many accidents will be avoided that there is really no way of regulating against.

Unfortunately, I know of a good many private owner pilots who have had very little cross-country experience, who take great pleasure in going over bad country in bad weather that pilots with more experience would never think of going over. These are the kind of pilots who are going to cause trouble to regular air lines who, because of the pilot's knowledge of conditions and terrain, and also because of good radio communication, will be coming through such weather and will naturally not expect to meet other than their own ships running in the other direction on the line, or at least machines properly equipped with radio.

Another thing that is sadly lacking here in America is the proper marking of towns. Most of the larger air-ports, of course, have their name marked on the building, but in many instances the airport is so hidden by smoke that one has to be directly over it and only about a thousand feet high to see it at all.

If one knows just where one is, it is possible, by the Department of Commerce maps which show the location of various airports in relation to rivers, railroads, etc., to find them. But if a pilot is lost and goes over a fairly large city and wonders where the airport is and what the name of the city is, his chances of finding it are not so very good.

NOTES FROM KENYA.

Sq. Ldr. the Rt. Hon. F. E. Guest, accompanied by Miss Spooner, Flt. Lt. R. Preston, Flg. Off. E. G. Hordern and Mr. H. E. Hamblen, a ground engineer, arrived some weeks ago in East Africa with three D.H. Moths.

In an interview with *The East African Standard* he said that the object of his visit is, in part, "to re-establish confidence in flying in East Africa which has been damaged by amateur pilots."

Sq. Ldr. Guest's definition of an amateur pilot in view of the above statement seems a trifle obscure.

Lord Carbery and Commander Robinson, late R.N., both Moth owners and therefore apparently amateur pilots, have done much excellent pioneer flying in Kenya. A number of other "amateur" pilots such as the Hon. Lady Bailey, Flt. Lt. Bentley and Flg. Off. Murdoch have passed through Kenya on their various journeys to and from the Cape and London,—and have made excellent impressions.

The fact that the residents of Nairobi have seen these pilots passing through without fuss and have heard of their successful arrivals at their distant destinations can have done nothing else but inspire confidence among all those sufficiently interested to follow their wanderings.

More recently Sir Piers Mostyn has become an enthusiastic Moth owner and has flown all over Kenya. At the present there are three "B" licence pilots, Lord Carbery, Mr. F. A. Swoffer and Mr. Campbell Black in Kenya, none of whom have, so far as one knows in England, done anything that should shake the confidence of the population in Kenya.

Flights to the Cape and back by Sir Alan Cobham and Mr. Van Lear Black and the annual R.A.F. Cairo—Cape—

Digitized by Google

Cairo exercises must all have helped to impress on the inhabitants of Kenya, through which all these flights have passed, the extreme mobility and reliability of aircraft.

Sq. Ldr. Guest announced to the Press that his aim was to provide in East Africa from the Zambesi to the Nile an internal air service which will augment the existing system of communications, connect the territories by a rapid and regular aerial link and assist progress by the usual aids of aviation.

Other than incurring the displeasure of those few experienced pilots in East Africa who are trying to aid the cause of aviation by hard work under adverse conditions the expedition has so far had little time to get its schemes under way.

Capt. Guest seems disappointed that the Kenya Colony Government has taken little heed of Capt. Tymm's surveys for aerodromes and landing grounds. This at any rate should provide him with ample material for pioneering aviation in that territory.

SUBSIDY FOR THE CAPE—CAIRO ROUTE.

A report from Johannesburg says that the South African Government is granting Imperial Airways a subsidy of £400,000, spread over a period of five years. This subsidy is for the forthcoming Cape—Cairo air route.

The South African Government will also provide landing-grounds and wireless stations for the portion of the route from Salisbury (Rhodesia) to the Cape.

THE FIRST PAN-AMERICAN AIR MAIL.

A report from the United States says that the first southward-bound and the first northward-bound Pan-American air mails have each reached their respective goals on schedule time.

The termini are Miami (Florida) and Buenos Aires. The distance is 7,000 miles and lies over 12 countries.

The time of nine days required by the air mail cuts the steamer mail by a half.

THE SHELL PARTY.

On Wednesday, Dec. 4, the Directors of Shell-Mex Ltd. gave a party at the May Fair Hotel to "a few of their special friends" in the Motor Trade and the Aircraft Trade. Roughly there were about 1,000 of them,—which may be taken as an indication of the popularity of the firm. The guests were received by Mr. Samuel Samuel, the Chairman of Directors of the firm.

The party, as good parties should, began at 23.00 hours and ended with the first delivery of milk next morning. Personally one went home early, but the morning papers were already on sale. Somewhere about 01.30, after an excellent supper, there was a motor-car race round the ball-room, which was really quite funny. Also, there was a cabaret show, half of which was extremely good.

All enjoyed themselves heartily and were sorry to go home. So one can safely tender the thanks of all the guests to Mr. Samuel and his co-directors.

SEAPLANE TESTING.

The first meeting of the 1929-30 Session of the Hull and Leeds Branch of the Royal Aeronautical Society was held in the Aviation Club, Brough, on Dec. 6. About 120 members and friends were present. Mr. E. Hudson, Secretary and Director of the Blackburn Aeroplane and Motor Co. Ltd., was in the Chair, and a lecture on "The Testing of Flying-boats and Seaplanes" was delivered by Mr. L. P. Coombes, B.Sc., A.C.G.I., of the Marine Aircraft Experimental Establishment, Felixstowe.

Mr. Coombes gave an account of the various standard tests applied to a flying-boat or seaplane after it had been delivered by the Contractor to the Station at Felixstowe. These tests include determination of weight and centre of gravity, time and distance of take-off, stability tests, and air performance trials.

The methods of testing and apparatus employed were clearly described, and in addition to standard tests many special tests, such as the determination of static thrust, and research work on the efficiency of water rudders, were explained. The lecture was illustrated by interesting lantern slides.

The next meeting of the Branch will be held in the Hull University College on Jan. 3, when Mr. V. J. Johnston, Wh.Ex., A.F.R.Ae.S., Assistant Designer of Boulton and Paul, Ltd., will deliver a lecture on "Metal Construction of Aircraft."

BRITISH PARACHUTES.

Mr. J. Tranum, the well-known parachutist, who handles the British Russell Parachute so well, writes:—

We note with interest the remarks made by Squadron Leader Pr[illegible] D.S.O., about parachutes during his lecture to the R.Ae.S. on Nov. [illegible] We suggest that he could not have had experience with the R[illegible] "Lobe" type.

This parachute is stated by users to be extremely comfortable, owi[illegible] to the seat and back cushion provided. The self-adjusting propert[illegible] of the harness also materially help in obtaining general comfort.

We think we should bring this point to your notice as we obser[illegible] Sq. Ldr. Probyn makes favourable mention of a foreign parachut[illegible]

SAFE HEIGHT FOR CHANNEL CROSSINGS.

Air Ministry Notice to Airmen No. 70 of the year 192[illegible] gives a scale of heights to be flown by cross-Channel aircraft.

The notice says:—

1. Aircraft not specially adapted for landing on water, when cr[illegible] the English Channel, should, subject to suitable weather condit[illegible] be flown at such a height that land can be reached in the even[illegible] the complete failure of one engine.

[Incidentally.—How does one *land* on *water*?—ED.]

2. In this connection pilots should inform themselves regard[illegible] the best combinations of air speed and angle of glide for the[illegible] aircraft under the above conditions, and hence ascertain the mi[illegible]mum safe height for the overseas route they intend to use.

3. The following information is added for general guidance. Th[illegible] heights quoted are to be regarded as approximate indications o[illegible] and not final in any individual case.

Overseas Route.	Max. distance fr m land in miles.	Suggested Minimum safe Flyin[illegible] Height.		
		Single-engined aircraft.	Twin-engined aircraft.	3-engine[illegible] aircraft.
		ft.	ft.	ft.
Dover to Calais	11	5,000 to 7,500	3,000	2,000

THE AERONAUTICAL DIARY, 1930

Actual size of Diary 4¾" by 3"

Bound in Royal Blue Leather with loop and pencil ... 3/-

In refill form, complete in Solid Blue Morocco Leather Wallets, complete 7/6

CONTENTS OF THIS DIARY WILL INCLUDE:

Valuable reference matter on Civil and Commercial Flying.

Addresses and Telephone Numbers of Aeronautical Clubs and Institutes, Aircraft and Aero Engine Firms, etc,

Flying Clubs, Addresses, Telephone Numbers and particulars regarding membership.

Flying Schools.

List of Aerodromes, with Addresses, Telephone Numbers, etc.

Leading particulars of Aircraft and Aero Engines.

Dates of Anniversaries, Lectures and Aviation Meetings.

Useful Tables.

Etc., etc.

104 Pages of Daily Diary, ruled for notes and giving daily events, anniversaries, etc.

CRESTS

This Diary is also available with the following crests embossed in Gold on the cover:

The Royal Aeronautical Society.
The Air League of the British Empire.
The Royal Aero Club.
National Flying Services.

When ordering please state the crest required.

Obtainable from the Publishers—

CROYDON NOTES.

On Thursday last there was a cap-full, or what might perhaps be more truly described as a bowler hat and a couple of trilbys, full of wind. Many air services were operated as usual, in spite of it, though on some routes the weather was unfavourable and some services were cancelled.

One newspaper, which had apparently arranged a "Great Gale" story in advance, took umbrage at this flying and announced on Friday morning that "Aeroplanes were unable to leave Croydon yesterday."

Far be it from us to annoy Fleet Street by flying on days when the Yarmouth Bloater Fleet has to run before the gale to the shelter of Wigan Harbour, and when Wapping Coal Barges are driven backwards up the Thames and wrecked on the desolate shores of Tagg's Island. If they will inform us in advance of any Great Gale they may be arranging in future, we will see what can be done for them.

As a matter of fact, most of us have hesitated to operate many services since Thursday last, and this may or may not have been due to our respect for the Penny Press.

On Friday most of us operated as usual. But Saturday was impossible flying weather and no services were operated.

Some adventurous Moth appeared in the teeth of the gale, however, on Saturday, flying more like a tumbler pigeon than an aeroplane. It landed safely at Croydon, after a series of miracles which would have set the pilot up for life as a Saint in mediæval times.

On Sunday there was no flying, and most services were cancelled on Monday. But on that day an early morning Air Union Goliath reached Croydon from Paris, and a Sabena 3-engined Fokker, piloted by M. Sobry, flew from Croydon to Brussels in 2 hours 17 minutes. Air Union operated outward to Paris from Lympne, and Imperial Airways inward from Paris to Lympne.

M. Cocquyt, Chief Pilot of the Sabena Company, was recently made Chevalier de la Coronne, a Belgian Order corresponding to the French Legion of Honour.—SPRY.

BY ERROR.—I.

In the list of people in the Trade who took the trouble to attend Sq. Ldr. Probyn's lecture, which was reported in THE AEROPLANE dated Dec. 4, Mr. O. E. Simmonds was described as being of the British Spartan Aircraft Co. Ltd. The companies with which Mr. O. E. Simmonds is connected, and of which he is a Director, are in fact Simmonds Aircraft Ltd., and the Simmonds Interchangeable Wing Co. Ltd.,—which names appear on Page 1276 of the same issue.

The inaccuracy of epithet was due to the fact that people habitually talk of "The Spartan Company," or "The Spartan people." And, referring to the firm colloquially, the adjective "British" was prefixed because there happens to be an American Spartan firm which is not connected with Simmonds Aircraft Ltd.

BY ERROR.—II.

Owing to an error in transcription in the report of the lecture of Mr. P. E. Hall, of Bendix-Perrot Brakes Ltd., to the Westland branch of the Royal Aeronautical Society recently, he was made to say that the Bendix airplane brake is made of steel and is then cadmium plated. As a matter of fact this brake is made of aluminium alloy. The error cropped up, presumably, because Mr. Hall described the construction of the automobile brakes which are made of steel pressings and then cadmium plated.

NEW COMPANIES.

SANDERSON STREAM LINING COMPANY LTD.—Private company. Registered Dec. 7. Capital, £100 in 10s. shares. Objects: To acquire any invention relating to the stream lining of steamships, motor-boats, water and air craft, motor-cars, and other vehicles, and to adopt an agreement with H. Sanderson. The directors are: H. Sanderson, 74, Malford Grove, Snaresbrook, E.18, consulting engineer (director of Henry Sanderson and Co. Ltd.). W. Adamson, 5, Fordington Road, Highgate, N. (director and manager of Walles Dove Bitumastic Ltd.).

CARTER INVENTIONS LTD.—Private company. Registered Dec. 3. Capital, £100 in £1 shares. Objects: To adopt an agreement with B. C. Carter, D. H. Kennedy, X. A. Stephens, J. R. Knowles, K. J. Thomson, and the President of the Air Council, to acquire patents, rights, brevets d'invention, licences and concessions, to carry on business as advisers, experts, consultants, engineers, metallurgists, technologists, contractors, etc.

The permanent directors are: Major D. H. Kennedy, Sweethorpe Cottage, Penn, Bucks. J. R. Knowles, Orpington Crescent, N.21, gentleman. A. Stephens (chairman), address not stated. Solicitors: Kenneth Brown, Baker, Baker, Essex House, Essex Street, W.C.2.

PERSONAL NOTICES.

DEATH.

FORBES.—On Dec. 3, at Henlow, Bedfordshire, as the result of a flying accident, Harold Vernon Forbes, Flg. Off., R.A.F.

Mr. Forbes entered the R.A.F. with a short service commission in July, 1926. After a course of flying training at No. 4 Flying Training School, Abu Sueir, Egypt, he was posted to No. 30 (Bomber) Squadron at Hinaidi, 'Iraq. He was promoted to Flying Officer in January, 1928. In August, 1929, he was posted to Henlow for the Engineering Course.

FORTHCOMING MARRIAGES.

HARE—FISHER.—The engagement is announced between Flt. Lt. B. W. T. Hare, R.A.F., elder son of the late Mr. B. F. T. Hare and Mrs. Hare, of Curtisknowle, South Brent, Devon, and Violet Fisher, elder daughter of Mrs. C. G. Bull, of 40, Bramham Gardens, S.W.5. The marriage will take place in India in February.

PELLY—SPENCER.—A marriage has been arranged, and will shortly take place, between Claude Bernard Raymond Pelly, R.A.F., eldest son of the Rev. D. R. Pelly, D.S.O., and Mrs. Pelly, of Woolbeding Rectory, Midhurst, and Margaret Ogilvie Spencer, daughter of Mr. and the late Mrs. E. J. Spencer, of 3, Grand Avenue, Hove.

WALKER—DANIELS.—The engagement is announced between Flt. Lt. Henry Walker, M.C., D.F.C., only son of the late Dr. Maurice Walker and Mrs. J. J. Roberts, of Buenos Aires, and Eleanor Louise, only daughter of Mr. and Mrs. Clark E. Daniels, of Madison, Wisconsin, U.S.A.

BIRTHS.

AIREY.—On Nov. 24, at The Barn, Easterton, Wilts, to Kathleen (*née* Spearing), wife of Flt. Lt. James L. Airey, R.A.F.—a daughter.

BARLOW.—On Dec. 1, to Rosamund (*née* Anderton), wife of Richard Hugh Barlow, R.A.F.—a son.

CAMPBELL.—On Dec. 6, at Farnham, Surrey, to Mollie, wife of Flg. Off. J. H. McNeill Campbell, R.A.F.—a daughter.

CORYTON.—On Dec. 5, at Castle Malwood, New Forest, to Philippa, the wife of Sq. Ldr. W. A. Coryton, M.V.O., D.F.C.—a daughter.

WHYTE.—On Dec. 6, at a nursing home at Uxbridge, to Sibyl, wife of Sq. Ldr. R. Whyte, R.A.F.—a daughter.

AYLESBURY BRAND BIFURCATED RIVETS

RIVETS BIFURCATED, TUBULAR AND SOLID.

Airwork Limited undertake all aircraft and engine repairs and overhauls. Fully qualified staff. Completely equipped service hangar. Heston Air Park. Hayes 410.

D. Watt, Brooklands Aerodrome, Byfleet 331. Houses machines and carries out overhauls of every description to aircraft and cars.

Heston Air Park. London's most accessible aerodrome. Perfect accommodation for private and commercial aircraft. Full service. Restaurant. Airwork Limited, Heston Air-Park. Hayes 410.

AIR SURVEY.

Air Survey Co. Ltd., 39, Grosvenor Place, S.W.1 (Sloane 6048), Dum Dum, Calcutta, and Monkey Point, Rangoon.

The Aircraft Operating Co. Ltd., 8, New Square, Lincoln's Inn, London (Holborn 8131), and Bulawayo, Southern Rhodesia; Cairo, Egypt; Rio de Janeiro, South America: Contractors to the Ordnance Survey. Laboratories and Subsidiary Company for aerial photography in the British Isles. Aerofilms Ltd., Colindale Avenue, Hendon (Colindale 6183 and 6184).

AIRCRAFT FOR SALE.

Brooklands School of Flying Ltd., Brooklands Aerodrome, Byfleet, Surrey. Second hand Moths with certificates of airworthiness, excellent condition, from £350. Hire purchase and part exchanges. Telephones Byfleet 436 and 437.

National Flying Services Ltd. (see page 1335). Quick deliveries. New or second-hand machines.

Phillips and Powis Aircraft (Reading) Ltd.—Authorised Moth Agents. Immediate delivery. Unique hire-purchase terms offered. Exchange Specialists. Reading Aerodrome. Sonning 114.

AIRCRAFT INSTRUMENTS.

Aeroplane Wheels, New. Fitted with Dominion 26 x 2½ heavy tread tyres, and new tubes. Pair, complete with axle and bushes, 70s. carriage forward; Windscreen Frames and Brackets, without glass 2s.; K.L.G. Plugs, F.9 new, 9s. 9d. doz. Revolution Indicators, Smith's, 600-2,600 r.p.m. with 3 ft. drive, 22s. 6d.; Above postage paid. Send for free list. Coley Ltd., Ordnance Works, Queen Elizabeth Road, Kingston-on-Thames. 'Phone 0365.

AIRCRAFT CAMERAS.

"Eagle" Aircraft Cameras and Equipment. Specialists in air photographic apparatus. Particulars from the manufacturers and patentees, Williamson Manufacturing Co., Litchfield Gardens, Willesden Green, London, N.W.10. Telephone 0073-4 Willesden. Telegrams, "Kinetogram Willroad London." Contractors to the Admiralty, Air Ministry, War Office.

PRACTICAL FLYING.

Brooklands School of Flying Ltd., Brooklands Aerodrome, Byfleet, Surrey. Flying instruction by experts of the greatest experience. No subscriptions or entry fees. Trial lessons £1. Telephones Byfleet 436 and 437.

CINQUE PORTS flying club (Subsidised). **WINTER RATES** commence Oct. 1. 6 months' sub. 31s. 6d. Entrance fee 21s. Monthly sub. 21s. No entrance fee. Seven of our members took "A" licences in 4 weeks ending Sept. 26. Under 2 hours by car from London. Enlarged Club Room and Bar. Send 6d. to Hon. Sec., Hythe, Kent, for illustrated brochure. **"LEARN AT LYMPNE."**

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn on latest types of Gipsy Moth, Hermes, Avian, and Gipsy Bluebird light aeroplanes. Chief Instructor, Captain V. H. Baker, M.C., A.F.C., Airwork Limited, Heston Air Park, Hayes 410.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

National Flying Services Ltd. (see page 1335). Join N.F.S. Learn to fly. Fly when you wish.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum of time. Special offer, trial lesson 12s. 6d. Reading Aerodrome. Sonning 114.

AIR TAXIS.

Air Taxis Ltd., Stag Lane Aerodrome, Edgware. 'Phone: Edgware 0849.

Aerofilms Limited, Aerial Tours, Taxi Work, Aerial Photography. Air Survey. Colindale Avenue, Hendon, N.W.9. 'Phone: Colindale 6183 and 6184.

British Air Lines.—Croydon Aerodrome. Cabin monoplanes for charter, day or night, all machines fitted with wireless telephony. Our own private car picks you up anywhere within a radius of 25 miles, free of charge. 'Phone:—Fairfield 5824. Telegrams:—Britalyne—Croydon.

National Flying Services Ltd. (see page 1335). Go by N.F.S., 1s. a mile; 1s. 6d. two passengers.

ENGINES FOR SALE.

A.B.C. Scorpion II engine for sale, £35. Can be seen at Croydon Aerodrome at any time. Surrey Flying Services, Croydon.

Two 110 h.p. Le Rhone Engines, complete with magnetos and carburetters, etc. Packed in cases and apparently new. What offers?—King, Northcroft, Byfleet.

FOR SALE.

Avro 504K Spares. New Main Planes; Cowlings; Undercarriages; Skids; Tanks, etc. Send for separate list. Coley Ltd., Queen Elizabeth Road, Kingston-on-Thames. 'Phone 0365.

FLYING CLOTHING.

No Connection with any other Firm.

S. LEWIS'S.—The Old Firm of Flying-Racing and Motor Clothing Fame, 19 and 27, Carburton Street, London, W.1. We wish our Thousands of Customers to know we have no connection with any other Firm. Flying Helmets, best Quality, Fur trimmed, 14s. 6d., 12s. 6d.; All Leather Lined Chamois, 10s. 6d., 12s. 6d.; Flat Type Phones, 5s.; Metallic Tubing and Rubber Connection, 2s. 6d.; Y Piece and Adapter combined, 3s. 3d.; White Flying Suits, 25s. 6d.; Ditto, with Lightning Fasteners, 35s.; White Combination Suits, 14s. 6d.; White Flying Helmet, 6s. 6d.; Featherweight type Goggles, fitted genuine Triplex Lenses, slightly tinted, new W.D., 7s.; Ditto, fitted genuine clear Triplex Lenses, 11s.; Aviation Mask Goggles, fitted genuine Tinted Triplex Lenses, 14s. 6d.; Ditto, fitted Tinted Triplex, 12s. 6d.; Meyrowitz Luxor Goggles, fitted Triplex unsplinterable lenses, 40s.; R.A.F. Scarf, 5s. 6d.; Pilot's Gauntlets, 12s. 6d. per pair; Suede Golf Jacket, best quality, ideal for flying, 50s. We are contractors to Foreign and Colonial Governments. S. Lewis's, 19 and 27, Carburton Street, London, W.1.

No Connection with any other Firm.

Wainwright's Flying Equipment.—Wainwright Flying Helmet (passed by A.M.) lined chamois, 22s. 6d. in Black or Tan, Fur trimmed helmets 12s. 6d., 15s. 6d. White helmets, pique or drill, 12s. 6d. Flat type earphones, complete with connections and "Y" pieces, 12s. 6d. Flying mask goggles, clear or anti-dazzle, 12s. 6d. Genuine R.A.F. Sidcots 57s. 6d. Chrome Leather flying coats, 84s. to £8 8s. Write for catalogue, Wainwright's, 300-302, Euston Road, London, N.W.1. 'Phone: Museum 6280.

Established over 30 years.

THE LEADING HOUSE FOR

AVIATORS' CLOTHING.

Suppliers to National Flying Services.

Fine quality R.A.F. pattern chrome leather coats, fleece lined 105/. and 120/-. Other styles from 85/-. Sidcot pattern flying suits, fitted with fur collar, 60/-. White flying suits, 23/6. Super quality white or khaki flying suits, fitted Zip fastener. 30/- and 35/-. White or khaki flying helmets, latest type, phone pockets, etc. 11/6. Approved Air Ministry pattern helmet, best chrome leather, chamois lined, 22/6-. Flying helmets, all leather, fleece lined, 12/6, fur trimmed, fleece lined 22/6; ditto, chamois lined, 25/- and 27/6. PERFECT FIT ASSURED. Lambswool lined gauntlets, from 18 6. Furbacked gauntlets, lambswool lined, from 25/-. Silk Under-Gloves, 3/6 per pair. Finest sheepskin flying boots, lambswool lined, fitted Zip fastener, 45/- and 63/-. Genuine D.H. 'phones, all metal, fabric covered, 12/6. Meyrowitz Luxor goggles, fitted Triplex, clear or tinted, 40/-. Featherweight goggles, round or pear shaped, unsplinterable, 7/6. Mask goggle, unsplinterable, fur or fleece lined, 12/6. Best quality suede Golf jackets, Zip fastener, 57/6 and 63/-

AVIATION PUBLICITY.

To All Aeronautical Firms.—The specialised advertising and marketing service required in the aviation field is provided by Aeromarine Advertising Ltd., 56-57, Fleet Street, London, E.C.4. (Tele.: Central 2423.) This service is free to clients. Leading aeronautical firms use this specialised organisation which has been built up by aviation experts. Write or 'phone.

SITUATIONS VACANT.

Aircraft Draughtsmen, 4 required immediately. Previous experience in metal construction desirable. Apply with full details of training and salary required. (London District.) Box No. 5745, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

First-class Aero-Engine Draughtsmen and Checkers required. Write, stating age, experience and salary required, to Frank B. Halford, 9, Golden Square, London, W.1.

Technical Staff, 3 Juniors required immediately for aircraft strength calculation. Fully conversant with A.M. methods (London District.) Box No. 5744, THE AEROPLANE, Cannon House, E.C.4.

Tool Room Foreman required for large Aircraft Works. Must be fully up to latest methods of drawing and rolling strip metal, press work, and a good disciplinarian. Apply in writing giving full details of experience and salary required. Box No. 5743, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Vacancies occur from time to time in Australia for Mechanics holding at least three licences, also for skilled Aircraftmen with experience of metal constructions. Applicants who are prepared to reside in Australia should write, in the first instance, to the Staff Manager, Box 4535, G.P.O., Melbourne.

SITUATIONS WANTED.

Ex-N.C.O. Pilot-Instructor. "B" licence, C.F.S. A.1. Category, 950 hours' Flying. 15 years' experience of I.C. engines, Aero, Car and Marine,—seeks post Home or Abroad. Box No. 5748, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

Photographer, ex-N.C.O., R.A.F., overseas, Naval and experimental establishment experience, seeks situation. Particulars to Box No. 5747, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

R.F.C./R.A.F. Ex-Officer, Engineer, 38, Aeronautical and Automobile, A.M.I.A.E., M.Ae.S.,—General experience extending over 20 years, including design, construction, inspection, technical, administrative and managerial duties, embracing aeroplane, seaplanes, airships, balloons, engines and general aircraft equipment, including modern all-metal construction; compilation of constructional reports and specifications. Capable interviewer and controller of staff, possessing inventive initiative and adaptability—appointments held include Chief Engineer, Chief Designer, Chief Inspector. Seeks change as Works Manager, Chief Inspector, Confidential Assistant, sales representative, or like—or alternatively invites inquiries in connection with any prospective flotation of Aircraft Company. Box No. 5746, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

TUITION.

For a Safe Exam. Pass enrol with the T.I.G.B.—Expressly designed for the benefit of prospective candidates for the leading Professional Examinations, including:—A.F.R.Ae.S., A.M.I.Mech.E., A.M.I.E.E., A.M.I.A.E., C. and G., etc. The T.I.G.B. correspondence courses furnish training of the highest standard; they possess the knowledge and experience of a most highly qualified tutorial staff and practically assure a safe exam. pass at the first attempt. (See "The Engineer's Guide to Success.") Write TO-DAY for a FREE copy of this 124-page book, which contains the widest selection of engineering correspondence courses in the world, and state your tuition requirements. *The T.I.G.B. Guarantees Training until Successful.* The Technological Institute of Great Britain (Established 1917), 249, Temple Bar House, London, E.C.4.

We offer sound Instruction in Aeroplane Design, Fitting and Rigging, and Aero-Engine Fitting and Rigging; also expert training for Ground Engineers (Categories A. B. C and D). All tuition is by correspondence. Write to-day for our "Aeronautical Engineering" Booklet. International Correspondence Schools Ltd., 179, International Buildings, Kingsway, W.C.2.

ON GETTING OVER OBSTACLES.

Troubles never come singly. Now that British craft manufacturers are beginning to realise what e market wants in our Overseas Dominions and eign countries, apparently they are finding that real obstacle to the export of British aircraft is a rrier erected by the Air Ministry. This is not a legal rrier nor a technical barrier but a plain physical barrier. No Aircraft Manufacturer can export aircraft without a rtificate of Airworthiness, under conditions laid down the Air Ministry. They can in fact build aircraft which e not certified as airworthy but as the British Airworthiss Certificate is a kind of hall-mark of excellence all e World over, nobody is going to buy British aircraft hich have not been certified as airworthy. And even if e British manufacturer agreed with some foreign buyer buy British aeroplanes without certificates, he would t be able to demonstrate those aeroplanes in cross-untry flights over the British Isles but would only be lowed to fly them within three miles of a recognised aeroome. Consequently, for practical purposes the Air Minisy's Certificate of Airworthiness is necessary to anybody ho wants to sell aeroplanes overseas.

Now these Certificates of Airworthiness are given for carrying certain definite loads. This load is not the weight which a given aircraft can carry without stalling, nor is it the load beyond which the aeroplane becomes dangerous to fly in case of meeting with bad atmospheric disturbances. Nor is it the load with which it can be made to perform aerobatics without fear of breakages. Such loads could in fact be calculated with something approaching scientific accuracy by simple arithmetic without any very deep mathematics, and under such circumstances nobody would object to them as a definite limit. The trouble in this case arises from the fact that the load allowed under the Certificate of Airworthiness is the weight which a given machine has proved that it can lift over a barrier of a certain height set up on an aerodrome, with a certain length of run.

ARBITRARY FIGURES.

Now the length of the run and the height of the barrier are two perfectly arbitrary figures, fixed by some officials or other of the Air Ministry entirely by their own judgment. Presumably they are intended to represent the length of an average English field and the height of an

**"BUILD TO-DAY, THEN, STRONG AND SURE,
WITH A FIRM AND AMPLE BASE;
AND ASCENDING AND SECURE
SHALL TO-MORROW FIND ITS PLACE."**

—(LONGFELLOW—*Builders.*)

GETTING OVER OBSTACLES.—The Martlet (75 h.p. A.B.C. Hornet 4-cylinder horizontal engine) built by the Southern Aircraft Co. Ltd. of Shoreham. This machine has a remarkable take-off and climb.

—(*"Aeroplane" photograph.*)

Digitized by Google

average English tree. As compared with definite measurements such as those on which such certificates should be granted, these are about as reasonable as saying that a thing is as large as a lump of chalk and as long as a piece of string.

A length of run which might seem long in this country would seem absolutely negligible on the open prairie in Canada or on the plains of Australia, or on the veldt in Africa. And the height of a tree which might seem to be a reasonable obstacle in this country would seem absurdly high in 'Iraq, where you only see one bush in miles. And at the other extreme it would be equally absurdly low in certain parts of California where the trees are so high that they say that two men and a boy are needed to see to the top of one of them.

Consequently any purely arbitrary figure fixed by a collection of Government officials amounts in effect to something like a conspiracy in restraint of trade.

A MATTER OF RIGHT.

This is a point which has in fact only just arisen in the British Aircraft Industry. The majority of the firms which compose the British Aircraft Industry are concerned with building war machines and not commercial machines. As the war machines are built entirely to Government requirements, naturally the Government has a perfect right to insist on those machines putting up a definite performance.

If the Government wants a heavy bomber to jump over a tree of a certain height, out of a field of a certain size, then it has a perfect right to lay down whatever figures it likes for that height and length. But it has no right to do so with a commercial aeroplane.

The length of run and the height to be cleared is a matter which can only be decided by the owner, or user, or pilot of the aeroplane itself. So long as the Air Ministry is prepared to certify that an aeroplane is fit to fly safely with a certain load without any danger of its breaking in the air through any shock it is likely to meet in the air itself, all that the Government has any right to demand is that its strength shall be up to that requirement.

The Government does not insist on a certain top speed, or a certain landing speed, or even a certain ratio between the two, which would be reasonable. Nor does it insist on a certain stalling speed or sinking speed, or a certain degree of visibility from the pilot's point of view, which would be still more reasonable. So it certainly has no right to insist on a certain length of get-off or initial angle of climb.

INTERNATIONAL COMPARISON.

The way this arbitrary rule works is as follows: As this paper has often pointed out, the market wants aeroplanes of a certain type which hitherto have not been made in England. That is to say it wants Cabin Monoplanes or at any rate cabin machines of some sort. And hitherto practically all machines of this sort which are doing any business have been built either in America or Holland. They are now built successfully in France, as those two remarkable voyages to Madagascar show. And now we are beginning to make them in England.

According to quite reliable information, none of the American machines of this type, such as those which are so popular in Canada, would have any chance of clearing the official Air Ministry obstacle with anything like the load which they commonly carry in Canada and the United States. And the American Department of Commerce which issues licences analogous to those issued by our Air Ministry, does not insist on any such tests of length and height in getting off or of landing.

In effect practically all these American aeroplanes are very much faster than ours, and are therefore definitely much better for air transport. But they take a much longer run in getting off. They land very much faster than ours do, but they are all fitted with wheel brakes, and consequently they actually stop in a shorter distance away from any trees or other barriers over which they have been compelled to land.

All the American Government does is to guarantee that the machines are properly designed and properly constructed so that they are not liable to break in the air. After that the buyer pleases himself whether he will use his machine with a long run and get off with a big load or whether he will have a short run and only lift a light load. That is quite reasonable and proper.

If such air transport machines as have been built in this country were judged only by the American standard, they could be certified as airworthy to carry hundreds of pounds more load than do the American machines, in or about the same category. But because our Government insists on this arbitrary test of height and length in getting off and only issues an airworthiness certificate for the load with which the machine has passed that test, then our machine can only be sold as airworthy at that load. And the buyer overseas or in a foreign country who is thinking of buying a British aeroplane considers that load certificate against an American load certificate which entails no obligation in getting off or in landing at all.

UNFAIR CONDITIONS.

Quite apart from our arbitrary standard, our method of passing a machine for its certificate is absolutely unfair because, even if we admit that the arbitrary figures are reasonable, aircraft may endeavour to pass the test under such varying conditions that the figures really mean nothing at all.

The length of get-off depends on the relative softness or hardness, or dryness or wetness, of the ground, and also on the quality of the ground. Also it depends on the strength and direction of the wind, and it depends on the state of the atmosphere, such as the humidity and the temperature.

KEEPING AHEAD.—The new Avro training machine (135 h.p. Armstrong Siddeley Mongoose engine). All-metal structure. New oleo undercarriage. Slotted wings. Hand-grip-holes in the lower wing-tips, to make handling on the ground surer. All points to show that the World's most popular training aeroplane is still keeping ahead of the times.

UNIQUE British Triumph! for Air, Land and Sea!

Air — 1918 A Napier-engined D.H. aeroplane climbed to a height of 30,500 feet in 66 minutes. At this time no human being had ever soared so high.

1921 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 163 4 m.p.h.

1922 A Napier-engined Supermarine flying-boat regained the Schneider Trophy for Great Britain at a speed of 149 m.p.h.

1922 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 180 m.p.h.

1923 A Napier-engined Gloster aeroplane won the Aerial Derby. Speed 192.4 m.p.h.

1926 The first non-stop crossing of South Atlantic Ocean carried out by Commandante Franco flying a Dornier flying-boat with two Napier engines.

1927 Schneider Trophy won by a Napier-engined Supermarine-Napier seaplane flown by Flight-Lieut. S. N. Webster, A.F.C. Speed 281.669 m.p.h.

1928 Capt. H. S. Broad, flying D.H. Hound, fitted with Napier engine, secured three World's speed records whilst carrying loads of 500 and 1,000 kilogrammes.

1928 The greatest formation flight ever carried out was made with four Supermarine-Napier Southampton flying-boats, each fitted with two Napier engines. The machines flew from England to Australia, round Australia and back to Singapore, covering 180,800 engine miles without mechanical trouble.

1929 The first non-stop flight from England to India was carried out with a Fairey monoplane fitted with Napier engine. 4,130 miles in 50 hrs. 38 mins.

Land—1929 The highest speed ever attained on land was made by Major Sir Henry Segrave when he drove his Irving-Napier car over one mile at the amazing speed of 231.36 m.p.h.
Capt. Malcolm Campbell set up world's land speed records at Verneuk Pan with his Napier Arrol-Aster as follows :—over 5 miles, speed 211 m.p.h.; over 5 kilometres, speed 216.53 m.p.h. They both used Napier engines

Water—1929 The world's motor-boat speed championship was won at Miami by Major Sir Henry Segrave, driving Sir Charles Wakefield's Napier-engined "Miss England."
Sir Henry Segrave at the Lido with the same boat made six runs over the measured mile, averaging a speed of 92.8 m.p.h.
At this meeting, competing against the best from Italy and America, Sir Henry Segrave won all trophies, including the Duke of Piedmont's cup and Count Volpi's cup.

One believes that at Martlesham Heath, where our machines are sent to pass the tests, every effort is made to get the machines through their test in a flat calm;—in fact the wind speed is measured while the machine is actually making its test and getting over the official barrier. If the anemometer shows that a gust against the machine has passed just while it was rising at the barrier, this is counted against it when issuing the certificate.

In the calculations everything is done to reduce the actual existing conditions to that terrible thing which scientists call "standard air." But although they may reduce the figures to standard air, they have not yet invented such a thing as "standard ground," and that affects the get-off even more than anything else. All of which shows that the test is merely silly. But worse than that it is definitely damaging to the possibility of sales of British Aircraft abroad.

A Silly Regulation.

This regulation is all the sillier because when the buyer has the machine in his own possession he can use it exactly as he jolly well pleases. If he has good clear ground and a good wind to help him off, he can overload the machine quite considerably. The Authorities cannot maintain an Inspector of the Aeronautical Inspection Department at every aerodrome to see that every machine goes off with a proper load or less. And the Insurance Companies cannot maintain such an official either. Consequently a freight machine or a privately owned machine can be taken off with just whatever load the pilot likes to carry. Regular air-line machines have to weigh-in their passengers and freight before starting, but there is no such check on charter-planes or private aircraft.

The real trouble about all this is that American machines work all right in Canada, where the air is good even in quite hot weather. Moreover, in Canada a very large number of machines are used fitted with floats, and have plenty of room from which to get off lakes and large rivers. And when they are not being used on floats, these machines are generally used on skis and have as much run as they like over open snow. Consequently the Canadian pilots do not have to worry themselves about small fields and high trees.

The curious thing is that when the Canadians want really handy nippy machines for their forest patrols and so forth,—machines which will get into and out of small spaces, either on land or on water,—they then use Moths or Avians, mere British-built light aeroplanes, in preference to American cabin machines with very much higher power. Yet the fact remains that for passenger transport or goods transport and high speed over long distances, the Canadians do use these American machines,—almost entirely because there is not a machine of that type built in England to meet their needs. And apparently, so long as this Government barrier exists, no English manufacturer is likely to find the building of such machines worth his while.

One is labouring this point somewhat, for the benefit of our fellow-subjects in Australia and South Africa and, for the matter of that in India and New Zealand, where before very long the American Aircraft Industry will start trying to dump aeroplanes of the types which are so popular in Canada.

The Effect of the Slump.

One had not expected the dumping of American aeroplanes into the British Dominions to begin for another three or four years. Judging by the way aviation was developing in the States there seemed no probability that the demand for aeroplanes in the United States themselves would be filled by the American Aircraft Industry for that time at least. But now, because of the financial slump in the States, the American Aircraft Industry finds itself with thousands of aeroplanes on its hands and nobody to buy them or use them.

The latest news from America says that the American Aircraft firms have at least five thousand aeroplanes in stock. The Ford Company instead of building three of their tri-motor machines a week and being months behind with deliveries, now have about twenty of these machines actually in stock. And there does not seem to be any prospect of their selling them in America.

Air transport in the United States is suffering from the general slump and from various other causes. Because of the slump, people who would have gone joy riding cannot afford to do so. People who would cheerfully have spent the extra price of air transport on necessary journeys over long distance are now content to travel by train,—if in fact they have enough business to justify their making a journey at all.

Also there have been many bad crashes in the United States lately with air-line machines and with their scenic-airway craft, as they call them. These crashes have choked off a number of passengers who would otherwise have become air travellers.

Added to that the Winter is now coming on and the holiday season is over. And so the Americans, so far as air traffic is concerned, are suffering from a financial slump and a seasonal slump and a moral slump all at once.

What then could be more natural than that the Americans should try to plant all their excess aircraft on the British Dominions? And everything seems to be open for them to do so.

In the Wide Open Spaces.

By agreement with the Canadian Government any aeroplane carrying an American Department of Commerce certificate is automatically regarded as airworthy in Canada. And when an aeroplane carries a Canadian Airworthiness Certificate, how can the Australian Government, or the South African Government, or any of our Central and East African Governments refuse to admit that machine into their territory?

If they do refuse, then the local agent for some American motor car or American agricultural implement who has been lured into becoming the local agent for an American aircraft firm is going to raise a terrific row with the local government.

The position is just a little bit like the trouble which South Africa constantly has with the Indian Government because our coloured fellow-subjects from India, all the way from coolies up to merchants of quite high standing, claim that because they are British subjects they have therefore a prescriptive right to go and work or trade in South Africa. The South African Government has quite

STILL PROGRESSING.—The all-metal Westland Widgeon (105-115 h.p. Cirrus Hermes). The Widgeon was the first British high-wing monoplane, among light aeroplanes, and with the Hermes it is still one of the handsomest of light aeroplanes and has a very high performance.

COMPLETE RELIABILITY DURING AN AGGREGATE OF OVER 26,000 MILES OF TROPICAL FLYING

* * *

For several years now, since its inception, the annual Royal Air Force African operations have been undertaken by a number of Fairey Aircraft from units stationed in Egypt. These annual flights, of which there are two, one known as the Kano and the other to the Cape, are of a very extensive nature involving many thousands of miles of flying near the Equator, including co-operation manoeuvres. That Fairey Aircraft should be chosen regularly for these arduous duties affords a definite indication of their exceptional merit.

enough trouble of its own with coloured labour, without importing more coloured labour backed by coloured merchants from India.

So one can quite see the Australian Government and the South African Government and our other Dominion Governments having quite a nice argument with the Canadian Government as to whether they have the right to refuse entry of an American machine with a Canadian Airworthiness Certificate.

If they do admit these American machines they may be sorry later on. Aircraft which would get off all right in the United States or Canada, over prairies or deserts or snow-clad plains, will be found quite a different proposition in Australia and Africa.

The machine that gets off lake level quite well in Canada will probably not get off the ground at all in Queensland, where,—when the boiling air is calculated down to what the scientists call "standard air,"—the sea-level aerodromes are actually under conditions which represent a height of 5,000 ft. in this country. And in Rhodesia and Kenya the aeroplanes start by being definitely at a height of 5,000 ft. or thereabouts, without allowing for the heat at all,—which probably puts them up to a standard air representing 8,000 ft. or 9,000 ft.

Experienced pilots who have flown out from England say that machines which can get off perfectly easily anywhere in Europe take a tremendous run in the East African highlands, and machines which can be floated onto the ground anywhere you like in Europe, simply fall out of your hand if you try to put them down in the same sort of way in Africa.

Our pilots in Queensland are so used to flying under these appalling conditions of heat that they have never worried to say anything special on the subject, but one does know from English pilots who have flown in Queensland that the same difficulties are found there about getting British aeroplanes onto the ground comfortably.

If all this difficulty is found with our aeroplanes which can be squashed down quite comfortably from a height of several feet and touch the ground gently, what sort of hope is there for those American cabin monoplanes, and open machines too, for the matter of that, which, as a Canadian correspondent said the other day, "land like a gliding paving-stone."

CONDITIONS IN AMERICA.

A member of the British Aircraft Industry who recently returned from the United States described air transport there as being in much the same state as it was with us in 1921. Everybody started by being frightfully optimistic, a lot of money was spent, machines of the wrong type were used for the wrong job, and then came the slump.

We discovered that we could not run air lines without subsidies and now, according to this particular report, they are finding the same thing in the States. At any rate, Pan-American Airways, who are running the Mail route down the West coast of South America to Chile, are drawing a subsidy of two dollars per pound per mile flown, or alternatively, if enough weight is not carried, they are paid by the American Government for space available for mail,—just in the same way as our Trans-Atlantic and other Mail Steamships are paid by the Government.

One has heard all this kind of thing before about finance, slumps and industrial slumps in America. The result always is that America's over-production is dumped in the British Dominions, and in countries where we have got a certain amount of trade, and our trade is promptly scooped by the low price of American dumped products.

We always use the same argument that American products are so inferior to English products. But the Overseas Buyer, if he can buy an American thing which is half as good as an English thing, and can buy it for a quarter of the price, reckons that he is making a profit of 100 per cent. on his outlay. Consequently the American gets away with the market while we are wondering what to do about it. And as usual history will repeat itself. And the American will get away with it if we are not quick to move.

THE REMEDY.

The obvious remedy for all this trouble is simply for our manufacturers to make what the market wants, and for the Air Ministry to remove the barrier which at present prevents us from competing in that market on equal terms.

So far as one knows, this matter of the Government barrier to export trade has never hitherto been raised. One feels sure that when our Director of Civil Aviation and our Director of Technical Development have their attention drawn to it, they will be all in favour of removing that barrier.

Their trouble will only begin when they try to get the barrier removed and have to deal with their own swarms of subordinates in minor offices, whose job consists chiefly in delaying the work of their superiors. Quite a number of reforms have been approved by senior officials and have then been held up for months or even years by their various scientific advisors and technical experts, each in his own little water-tight cubby-hole down inside the Air Ministry raising objections or causing delay.

This is a matter which might very well be taken up by the Secretary of State for Air and the Under-Secretary of State for Air themselves and pushed through with the weight of the Cabinet behind them. Our Government is all out to decrease Unemployment, and one of the best ways of decreasing unemployment is to increase export trade. Here is a very simple way of doing it.

One of the worst troubles is that so few firms in the British Aircraft Industry are at all interested in this class of business. At any rate there are not enough interested in it to produce anything in the nature of concerted action. But action of some sort is of vital importance to those people who do want to do trade overseas in commercial aircraft.

In fact one very much doubts whether the firms in the British Aircraft Industry who are chiefly concerned in making war machines even know that this particular barrier to overseas trade in commercial aircraft exists at all. When they do learn about it, they will probably be sympathetically indignant, but that is all, because it does not immediately affect them individually.

Though one does profess to know most of the things which hinder our foreign trade, especially the obstinacy of the British Aircraft Industry themselves, one has only just heard of this particular obstacle, and so one feels a bit

THE GUGNUNC.—The Handley Page biplane (135 h.p. Armstrong Siddeley Mongoose) designed for the Guggenheim Safe Aircraft Competition, with automatic slots (lately nicknamed "climbing irons") all along the leading edges of the planes, and flaps along the trailing edges to increase the camber of the wings. Thus the whole machine is designed to get over obstacles.

like the famous sailor-man who, on coming out of a Mission House down by the Docks, met a Jew and murderously assaulted him,—on the grounds that he himself had only just heard of the Crucifixion for the first time.

In a general way one can claim that for quite a long time one has been one of the chief champions of the Air Ministry against the complaints of all and sundry. In this particular instance one feels that one may revert to one's old part of chief assailant of the Air Ministry. Quite possibly some Aircraft Manufacturers themselves, now that they have become so accustomed to the rules and regulations set by the Air Ministry, may be glad to have somebody to do the attacking which, if they did it themselves, might bring upon them reprisals from Air Ministry officials.

Do It Now.

At any rate, to sum up the whole position, if we do not go all out for the trade in air transport vehicles in our Overseas Dominions and in foreign countries within the next few months, then those countries are somehow or another going to be flooded with dumped American machines.

Even if the brightest of our Aircraft Manufacturers set to work at once and build sensible air transport machines they cannot very well start delivery before March, say, and probably not before June. By that time probably, there will be ship-loads of American aircraft on the high and free seas on their way to our Dominions. If we rush out some good sample machines which entirely out-perform the American machines under local conditions, we may have a chance of staving off the buying of those American machines until we can build enough to fill the local demand. But before anybody finds it worth his while to build such machines, the Government must remove that barrier.

In a certain measure the position is a little like [illegible] which caused us to lose the overseas trade in motor [illegible] That again was primarily due to the fact that the Br[illegible] Manufacturer was too stupid or too self-satisfied to [illegible] what the market wanted. But a Government regu[illegible] contributed very largely to the fact that we never had [illegible] motor cars suitable for the Colonial market.

The British Government started taxing motor cars [illegible] the bore of their cylinders. The British Motor Manufacturer proceeded to build small engines with a very [illegible] bore and a long stroke and enormously high revolu[illegible] which stood up pretty well on English roads but cost [illegible] enormous amount for repairs, and were, and still are, [illegible] useless on Colonial roads, or where there were no r[illegible] at all, as in most of our Dominions.

The Americans, with whom their Government did [illegible] interfere in the least, made cars which suited their [illegible] demands and incidentally happened to suit the dem[illegible] of our Dominions. And so the American motor-car [illegible] got the whole market.

Here again we have a Government Department, in [illegible] case the Air Ministry, imposing regulations on a Br[illegible] transport vehicle, to wit, the aeroplane, with the inten[illegible] of making it safer, or at any rate more suitable for Br[illegible] conditions. This is an entirely praiseworthy intention [illegible] the most unkind thing that one can say of anybody is th[illegible] they "mean well," and in this case our poor dear Air Mi[illegible]try distinctly means well. All we can do is to hope th[illegible] in the interest of British Trade overseas and in the inter[illegible] of decreasing unemployment in this country, they will ce[illegible] to mean well but will do well by removing that barrier.—C. G. G.

INTERNATIONAL OBSTRUCTION.

In the debate on Foreign Affairs in the Second Chamber at The Hague during November Herr Knottenbelt suggested that the British Authorities in England and India were placing difficulties in the way of the Holland—East Indies air service.

He said that the Dutch services were working well while the British services overseas were still defective. He suggested that—as a British Imperial air line to and from Australia was impossible without the co-operation of the Dutch Indies—the application of the principle of reciprocity might affect the British Government's attitude.

Herr Knottenbelt's speech refers to a statement that Dutch aircraft operating a regular line from Holland to the Dutch East Indies will not be permitted to fly across India after Jan. 1, 1930. This objection is advanced primarily by the Indian Government.

Hitherto the Dutch have made a number of experimental flights to the East Indies and permission to use the landing grounds en route has been readily granted. India now considers that the landing grounds are not fully enough prepared to permit their use for a regular service.

The Dutch company has said that it would be prepared to take the risk of continuing to use the landing grounds as they are, but permission is still withheld.

In 1928 and 1929 a number of experimental flights were made between Holland and the Indies. A large proportion of this year's flights met with trouble owing to weather conditions and bad landing grounds.

While everyone will sympathise with this set-back to Holland's courageous attempt to develop long-distance air transport, a certain amount of reasonable consideration should be given to both sides of the argument.

The backwardness of the Indian Government in laying down chains of landing grounds is due to lack of adequate appropriations of money. When money is forthcoming India will naturally expend money on aerodromes on routes that are to benefit Indian conditions first, which, after all, is only natural. There is no doubt that a Calcutta—Karachi route will be one of the first to receive attention.

The regulations of the Indian Government, which call for a large proportion of Indian capital and personnel in the constitution of Indian air transport companies, leaves Great Britain in an almost as hopeless position as is Holland in expecting rapid progress in Indian Civil Aviation. Imperial Airways, as it is constituted, is no more free to fly regularly across India than is the K.L.M.

The Indian Government is justified in restraining the passage of an air line carrying passengers, mail and freight, no matter of what nationality, over its vast territory, while conditions are such that serious accidents may happen through natural conditions for which the Government would innocently be held responsible.

Herr Knottenbelt's statement that the Dutch services are working well while the British services overseas are still defective is one of those political innuendoes that make certain parliamentary utterances so futile, or spiteful.

His references to British services overseas obviously refer to the misfortunes of the England—India service, a service which has been operated in the face of difficulties of kind similar to those which are preventing the operation of the Holland—East Indies Service.

At any rate, our good friends in Holland may rest assured that they cannot be more irritated by the futility and fatuity of the Indian Government than are those people in this country who have the misfortune to have dealings with it. And one fears that we may all look forward to a still worse state of affairs when India gets self-government—which state is likely to continue till the natives get themselves into such a mess that they have to call us in again to straighten things out for them.

MR. SPOONER'S COMING OF AGE.

Early in the New Year the oldest aeronautical newspaper in the English language, our valued contemporary *Flight* will complete twenty-one years of publication. On behalf of all aeronautical people we of The Aeroplane extend to its editor, Mr. Stanley Spooner, the heartiest congratulations.

Flight was in fact started as an offshoot of *The Automotor Journal*, later known as *The Auto*, very much as some six months later I had the honour of starting *The Aero* in June, 1909, for Iliffe and Sons Ltd., of Coventry, as an offshoot of *The Autocar*. But whereas I was pitch-forked purely accidentally into reporting the first aero show in the World, in Paris at Christmas-time, 1908, my old friend Stanley Spooner had long been interesting himself in aeronautical affairs, and was one of the very earliest members of the Aero Club, long before it became the Royal Aero Club.

Very properly, to commemorate Mr. Spooner's long association with aeronautical affairs, Colonel the Master of Sempill is organising a dinner in his honour, which dinner will be held somewhere about Jan. 3. And naturally the function will have the support of the Royal Aeronautical Society, the Royal Aero Club, the Air League, the Society of British Aircraft Constructors, and, one hopes, the Guild of Air Pilots and Navigators, all of whom owe much to the efforts of Mr. Spooner.

The original idea was to have a more or less personal gathering of the older friends of Mr. Spooner who are associated with the various organisations above-mentioned. But there may be, and there certainly ought to be, a feeling among other people not necessarily holding official positions in those organisations that they also would like to show their esteem and regard for Mr. Spooner.

If that be so, as one hopes it is, all who would like to attend this gathering are advised to write as soon as ever they can, to Colonel Sempill at the Royal Aeronautical Society, at 7, Albemarle Street, London, W.1, expressing their wish to be present. If many people wish to go to the dinner the date will probably have to be postponed so as to make suitable arrangements.—C. G. G.

THE ROYAL AERO CLUB CHRISTMAS CLOSING.

The Club will be entirely closed from 07.00 hrs. on Tuesday, Dec. 24, to 08.00 hrs. on Friday, Dec. 27.

The Club will also be closed on Saturday, Dec. 28, from 15.00 hrs. till 24.00 hrs. for the Club Staff Christmas Party

ARMSTRONG WHITWORTH
AIRCRAFT

THE ALL STEEL ATLAS
(ON WHEELS, FLOATS OR SKIS)

THE all-steel Atlas is the best aircraft for land or sea reconnaissance.

It is the standard Army Co-operation two-seater of the Royal Air Force.

Its steel construction accounts for its unrivalled durability and ease of maintenance. Fitted with the world-famous Armstrong Siddeley Jaguar engine (plain or geared type), its speed, climb and ceiling fulfil the severest Service requirements. It is produced on the grand scale by the best equipped aircraft works in Europe.

A NEW RECORD BY M. COSTES.

M. Costes began on Dec. 15 an attempt to beat the World's Record for distance in a closed circuit, at present standing in the names of Capt. Ferrarin and the late Major del Prete with 7,666 km. (4,760 miles).

The machine is the "?" used by Costes for his recent successful attack on the long-distance record. M. Codos, the well-known Air Union pilot, is the second member of the crew.

At the moment of going to press news came that they had landed after covering 4,916 miles.

They used a Hispano-Suiza engine of 600 h.p.

A COSMOPOLITAN ATTACK ON THE DISTANCE RECORD.

A Bréguet with Captain Challe (France) and Colonel Larre Borges (Uruguay) left Seville at 12.30 p.m. on Dec. 15 in an attempt to break the World's long-distance record for a non-stop flight recently captured by Costes and Bellonte.

The Bréguet took off with 4,150 litres (913 Imperial gallons) of fuel on board. Five hours and twenty minutes after taking off the Bréguet flew over Rio de Oro (West Africa).

Some hours later it was sighted some 600 miles south-west of Cape Verde by a Spanish steamer during the early afternoon of Dec. 16.

A wireless message was received at 5.40 p.m. (G.M.T.) asking for a report of weather conditions along the Brazilian coast.

At 13.00 hrs. G.M.T. on Dec. 17 Capt. Challe's machine passed Maceio, about 120 miles south of Pernambuco, Brazil.

They landed and crashed in the State of Rio Grande del Norte, about 50 miles from the coast.

Like MM. Costes and Codos they used a Hispano-Suiza engine of 600 h.p.

MADAGASCAR—REUNION.

MM. Goulette, Marchesseau and Bourgeois, who recently flew from Paris to Madagascar in a Farman F-190 cabin monoplane (230 h.p. Salmson engine), had been held up at Antananarivo owing to the severe illness of M. Goulette. On Nov. 16, three weeks after their arrival and after the recovery of M. Goulette, they left Antananarivo and flew a complete circuit of Madagascar, stopping at Maevatahana and Majunga.

On Nov. 20 they flew to Antsirabe and back.

On Nov. 24 they flew to Tamatave, but in landing one wheel sank into some soft sand and the machine stood on its nose. The airscrew suffered the only damage and this was bent straight by a local mechanic.

On Nov. 26 they left Tamatave and flew to the island of Réunion over 380 miles of sea, and their arrival at Saint-Denis was made the occasion of great enthusiasm. Their Farman-Salmson was the first aeroplane to be seen in this distant French Colony. The crew suffered four days of entertainment during which time the various notabilities of the island, including the Governor, were given their *baptêmes de l'air*. On Dec. 2 they left Saint-Denis for Tamatave, carrying a quantity of special mail for Madagascar and France.

On their way back from Antananarivo to Mozambique they were lost, and after some time the assumption was that they were dead.

They were rescued from Juan de Nova Island by the s.s. *Gallieni*. The three aviators are well and the mail they were carrying is intact.

The three pilots of this flight must not be confused with MM. Bailly, Reginensi and Marsot who also flew from France to Madagascar in a Farman F-190 monoplane, but with a Gnôme-Rhône Titan engine. These three last-mentioned pilots have since returned to France from Madagascar in eight days.

A new attempt to fly to Madagascar in a Farman 190 (240 h.p. Lorraine radial air-cooled engine) is to be made by MM. Roux, Caillol, and Dodement,—the first as pilot, the second as navigator, and the third as mechanic.

The flight will be made in the longest possible hops. This is of interest because the object of these flights is to organise air *mail* lines, and The Aeroplane has always said that fast single-engined machines making long hops are the best for this job.

A BREGUET TRI-MOTOR?

There is some talk in France of a forthcoming attempt by M. Costes to fly to Australia, presumably by long stages. The machine will be a new Bréguet tri-motor, which is reported to be under construction in the Bréguet works. This will be the first three-engined aircraft built by the Bréguet firm.

A NEW FRENCH FLIGHT TO SAIGON.

On Dec. 14 MM. Rébard, Lassale, and Faltot left Paris in a Nieuport 641 cabin monoplane with a 230 h.p. Lorraine air-cooled radial engine on a flight to Saigon, Indo-China.

The first stage to Tunis was completed non-stop in twelve hours.

AN ITALIAN ATTEMPT ON THE ENDURANCE RECORD.

After flying for 44 hours 30 minutes in the Savoia 55 monoplane Major Maddalena and Lt. Cecconi were forced to land by violent wind squalls which increased the petrol consumption and ruined the chances of breaking the existing record of over 65 hours. The attempt was made at the Montecelio Aerodrome near Rome.

GLIDING.

THE BRITISH GLIDING ASSOCIATION.

One gathers that the British Gliding Association is forging ahead. Various important authorities are very amicably disposed towards the new movement.

At the General Meeting shortly to be held, enthusiasts will find that a skeleton organisation has been built up. This organisation will allow the enthusiasts to form local groups and start in right away, either to build their own machines or to fly bought gliders from selected sites.

A good idea seems to be for the Association to have a Central Committee which will be able to confer, and transact business, with the various people with whom such an organisation must come in contact.

This Central Committee could also be responsible for airworthiness, the selection of sites for gliding, and the general good behaviour of the local groups who will otherwise run their own shows.

One would say as a personal view that the sooner these groups get going the better so that possible sites may be discovered and tested before the lecture by Dr. George.

All those interested are invited to write to Mr. L. Howard Flanders, c/o The Royal Aeronautical Society, 7, Albemarle Street, W.1.

LEARNING TO GLIDE AT GEELONG.

The Aeroplane of Nov. 20 reported the formation of a Gliding Club at Geelong in Australia and gave a short account of their first public demonstration.

A letter to this office from Mr. Pratt of the Aircraft Manufacturing and Supply Co. of Australia, Pty., Ltd., who built the Club's glider, contains some interesting facts.

The glider (of the Zœgling type) costs about £100. The craft is very stable, and will almost parachute to earth. When about 25 feet off the ground the glider is put into a glide and it lands between 10 and 15 m.p.h.

A system of lessons on the ground has been evolved and tried out, after which the pupil is given a short glide from a catapult start. As the pupils gain confidence and skill they are launched from successively higher places on the hill until they can be launched from the top.

The pupils have no dual control lessons whatever, and so far no damage has been done to the glider.

These notes are of obvious interest to gliding enthusiasts because the Geelong Club shows how an interested group of people can start gliding and evolve a training system.

After this glider had been built various aeroplane pilots, like Mr. Pratt, flew it. So soon as they had found how it differed from power-driven machines they started in to teach the novices.

LEARNING FROM GLIDING EXPERIENCE.

One of the German Gliding Clubs has enclosed the pilot's seat on their Zoegling type glider. This has had the effect of improving the gliding angle from 1 in 8 to 1 in 12 and giving the glider improved rudder control. The pilot has a greater sense of security, but owing to the small dimensions the rudder bar has had to be made unpleasantly short.

The nacelle has been built of 2 mm. and 1½ mm. plywood to a streamline section (Gœttingen 410) with the greatest breadth just forward of the pilot's seat.

SOARING FLIGHT.

[*Der Segelflug*. By Walther Kleffel. VIII plus 178 pages. 83 pictures. 10s. net. Can be got to order from The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4.]

Those who are interested in gliding and are able to read German will find much to interest them in *Der Segelflug* recently written by Herr Walther Kleffel. This book deals with the flight of birds, gliding and soaring, a review of the Rhoen gliding, the work of the latest soarers, and in a general way with everything to do with soaring flight except the actual design and construction of gliders.

Herr Kleffel is one of the most energetic journalists in Germany. Whether he is dealing with the politics of aviation or with the design and construction of aircraft and airships, he is always entertaining. He was a passenger in the *Graf Zeppelin* on its recent trans-Atlantic flights. And he has an all-round useful knowledge of aeronautics. Our old friend Herr Oskar Ursinus of *Flugsport* describes the book as a literary history of the Rhoen gliding.

A PISTOL-SHOT.—The Stadium at Wembley taken by Mr. Nigel Norman (seen in the picture below) with a Williamson pistol camera. (This picture is twice the width of the original print.)

THE ROUND-EUROPE COMPETITION.

The organisation of the 1930 Coupe Challenge Internationale de Tourisme will be in the hands of the German Aero Club by virtue of the 1929 contest having been won by Herr Morzik, on a B.F.W. M.23 monoplane.

A commission has been formed which includes representatives of the Ministry of Communications, the Aerial Police, the *Deutsche Luft Verband* and various other societies. And a smaller specialised Committee is studying the question of rules,—which will later be submitted to the Commission.

The contest will include a tour of Europe which will begin and end at the Tempelhof aerodrome, Berlin, and all technical tests will take place at Staaken after the tour of Europe. The rules which existed for the 1929 Contest will be substantially modified.

In addition to the countries which supported the Competition last year it is rumoured that Great Britain, Rumania, Poland and the United States are showing interest and may be considered as likely participants next year.

All will hope that England will compete next year, for this is the one great international event of the year, and the winning of it is as good an advertisement for a light aeroplane as is the Schneider Trophy for a seaplane. In fact it is a better advertisement, because the winner proves his superiority over so many competitors, whereas in the Schneider Contest, there is always the argument that dozens of designers might have beaten the actual competitors if somebody had found the money to build their machines.

THE WILLIAMSON PISTOL CAMERA.

The Williamson Manufacturing Co. Ltd., the manufacturers of the famous "Eagle" aircraft camera, have produced a small camera of light weight and comparative cheapness suitable for the use of the amateur air-minded photographer.

This camera is known as the Williamson "Pistol" Aircraft Camera. It consists of a main body and a pistol hand-grip made of duralumin, with a stainless steel trigger release.

The standard lense is a Ross Xpres of 5 ins. focus, with an aperture of F 4/5, large enough for fully-exposed photographs to be taken at the maximum speed of the shutter (1/100th of a second) either with or without a light-filter.

The shutter, of the sector type, is fitted between the lense combination and is adjustable for speed and aperture. A focussing mount and scale can be supplied if necessary.

The back of the camera will take either plate holders, film-pack adapter or a focussing screen with hood. A brilliant view-finder is fitted in a rigid tunnel on top of the camera.

The size of picture taken is 3¼ in. x 2¼ in. (9 cm. x 6 cm.) and the total weight of the camera is 3 lbs. 5 ozs.

The light weight and the pistol grip enable the camera to be used with ease in the air. If the pilot wants to do the photography, or should the passenger have additional duties to perform, a special mounting is supplied which can be clamped on the side of the fuselage. This mounting has a variety of movements, and the camera may be used with the view-finder either on top or underneath, whichever is nearer the eye level.

Full particulars of this camera will be gladly supplied by the Williamson Manufacturing Co. Ltd., of Litchfield Gardens, Willesden Green, London, N.W.10.

ROYAL AERO CLUB MEMBERSHIP.

The Committee of the Royal Aero Club has decided that members of Associated Light Aeroplane Clubs, holding current "A" or "B" Licences, shall, subject to election, be admitted to membership of the Royal Aero Club at a reduced subscription of £3 3s. with no entrance fee. This only applies to full flying members of the Associated Light Aeroplane Clubs.

THE LONDON CLUB RAFFLE.

The London Aeroplane Club will raffle an entirely-new latest-type Metal Gipsy-Moth, fitted with Slots, Compass, Telephone, etc., painted in any colours desired by the Winner. The number of tickets is limited to 1,500. Tickets 10s. each may be had from the London Aeroplane Club, 3, Clifford Street, London, W.1, or Stag Lane Aerodrome, Edgware.

JUPITERS IN DENMARK.

The Danish Government after long tests with various types of aero-engines has placed an order for a number of 450 h.p. Bristol Jupiter engines.

"Bristol"

The "Bristol" method of Steel aircraft construction has been evolved through years of patient research and experimental work, until to-day it represents the most efficient and most durable method of steel construction. Nothing but the finest quality high tensile steel is used in the structural portions of "Bristol" aircraft, and the special design and arrangement of the air frame members make the duties of maintenance and repair at once easily and quickly accomplished. Information upon the general upkeep and execution of field repairs is always available at the "Bristol" Company's works. In this connection special tools have been designed and manufactured which make it quite possible for semi-skilled labour to be used to execute repairs to aircraft, that might well in many cases prove an expensive and prolonged job.

RUMANIA is the most recent of the many Dominion and Foreign Powers to adopt the Gipsy Moth for training purposes in the

RUMANIAN AIR FORCE

By the use of the Moth an intermediate training machine is rendered totally unnecessary, a pupil passing direct from the Moth to high powered Service aircraft.

Rumania's choice, coupled with that of other Powers, is of immense significance, substantiating once again the claim that Moth is "the best training aircraft in the World."

The London Gazette.

Air Ministry, December 10.

ROYAL AIR FORCE.

:ENERAL DUTIES BRANCH.—Lt. J. H. F. Burroughs, R.N., is reattached the R.A.F. as a Flg. Off. with effect from Dec. 5, 1929, and with iority of June 16, 1924.

lt. Off. R. C. I. Pearse is promoted to the rank of Flg. Off. (Nov.

q. Ldr. F. Fowler, D.S.C., A.F.C., is placed on the half-pay list, le A (Dec. 10).

he following Flt. Lts. are placed on the retired list at their own uest:—A. T. Laing (Oct. 20); W. V. Simons (Dec. 11). The follow- are transferred to the Reserve, Class A:—Flt. Lt. A. J. R. Moss, . Off. B. C. Mason (Dec. 9); Flg. Off. A. L. Mortimer (Dec. 11).

:HAPLAINS BRANCH.—The Rev. R. M. Bankes-Jones, M.A., is pro- ted to the relative rank of Wing Cdr. (Dec. 3).

RESERVE OF AIR FORCE OFFICERS.

:ENERAL DUTIES BRANCH.—D. C. Beauchamp is granted a comn. in the pcial Reserve as a Plt. Off. on probation (Oct. 14). Plt. Off. E. W. ckay is promoted to the rank of Flg. Off. (Dec. 7). The following . Offs. are transferred from Class A to Class C:—R. S. Walter v. 24); W. F. Warner (Aug. 24); E. M. S. Spence (Nov. 17).

Flg. Off. J. de la P. B. Preston is removed from the service (Nov. 28).

AUXILIARY AIR FORCE.

GENERAL DUTIES BRANCH.—No. 600 CITY OF LONDON (BOMBER) UADRON.—Flt. Lt. C. G. Jenyns resigns his comn. (Nov. 19). No. COUNTY OF LONDON (BOMBER) SQUADRON.—The following to be Plt. :—R. Y. Sanders (Aug. 8). No. 605 COUNTY OF WARWICK (BOMBER) UADRON.—The following to be Plt. Off.:—B. P. A. Vallance (Oct. 12).

Appointments.

Week ending December 16.

GENERAL DUTIES BRANCH.—Group Captain I. G. V. Fowler, A.F.C., to A.F. Depot, Uxbridge, to command, 1/12.

Wing Commanders R. M. Bayley, D.F.C., to R.A.F. Depot, Uxbridge, nding course at Imperial Defence College, 2/11. V. Gaskell-Blackburn, S.C., A.F.C., to School of Balloon Training, Larkhill, to command, /11. D. G. Donald, D.F.C., A.F.C., to School of Naval Co-operation, e-on-Solent, to command, 30/11.

Squadron Leaders J. L. Vachell, M.C., to No. 8 Sqdn., Aden, 14/11. J. Maclean, M.C., to No. 1 School of T.T. (Apprentices), Halton, /11. B. E. Baker, D.S.O., M.C., A.F.C., to No. 32 Sqdn., Kenley, /11. R. B. Mansell, O.B.E., to Air Ministry (A.M.S.R.), 19/12. P. G. cott, to No. 29 Sqdn., North Weald, 25/11. F. O. Soden, D.F.C., No. 14 Sqdn., Palestine, 22/11. L. G. le B. Croke, to R.A.F. Depot, xbridge, 27/11.

Flight Lieutenants G. A. Simons, to No. 1 Sqdn., Tangmere, 1/12. B. Barrett, to Armoured Car Wing, 'Iraq, 23/11. C. D. Pyne, to No. Sqdn., Hawkinge, 19/11. W. C. P. Bullock and H. M. Mellor, to A.F. Depot, Uxbridge, 27/11. T. O. Clogstoun, to No. 1 Air Defence roup H.Q., 29/11. E. J. Protheroe, to R.A.F. Depot, Uxbridge, 22/9. Martin, to School of Naval Co-operation, Lee-on-Solent, 2/12. E. Horrex, A.F.C., to No. 58 Sqdn., Worthy Down, 9/11. C. A. ouchier, D.F.C., to R.A.F. Depot, Uxbridge, 9/11.

Flying Officers C. A. Pearson, to R.A.F. Depot, Uxbridge, 11/11. L. Truman, to No. 31 Sqdn., India, 6/11. W. Anderson, to R.A.F. ase, Calshot, 18/11. T. H. Moon, to A.A.E.E., Martlesham Heath, 2/12. C. Greenhalgh, to No. 99 Sqdn., Upper Heyford, 27/11. J. E. W. owles, J. A. T. Ryde, H. W. Charnock, R. J. A. Ford and R. J. rummond, to R.A.F. Depot, Uxbridge, 27/11.

Pilot Officers C. B. Field, to No. 14 Sqdn., Palestine, 19/11. N. R. G. Hunter, to No. 45 Sqdn., Middle East, 18/11. A. H. Abbott, to No. 8 Sqdn., Aden, 14/11. R. W. Wallace, to No. 216 Sqdn., Middle East, 14/11. W. H. E. Tew, to No. 216 Sqdn., Middle East, 14/11. K. W. Niblett, to No. 36 Sqdn., Donibristle, 25/11. I. B. Newbigging, to No. 36 Sqdn., Donibristle, 25/11. W. S. C. Adams, to R.A.F. Depot, Uxbridge, 15/11.

MEDICAL BRANCH.—Squadron Leaders T. C. St. C. Morton, M.D., M.R.C.P., D.P.H., D.T.M. and H., to R.A.F. General Hospital, 'Iraq, 30/10. R. H. Bebb, O.B.E. (Dental), to R.A.F. General Hospital, 'Iraq, 30/10.

Flight Lieutenants T. J. D. Atteridge, to H.Q., R.A.F., Middle East, 29/11. R. E. Edwards (Dental), to H.Q., R.A.F., Middle East, 29/11. J. E. Foran, M.B., to M.A.E.E., Felixstowe, 22/12. R. Boog-Watson, M.B., D.P.H., to H.Q., 'Iraq Command, 22/11. D. A. Wilson, to H.Q., 'Iraq Command, 22/11. J. C. Neely, B.A., to H.Q., 'Iraq Command, 22/11. J. Parry-Evans, to Palestine General Hospital, 4/11. H. Penman, M.B., to No. 6 Sqdn., Middle East, 1/11. E. P. Carroll, to No. 4 F.T.S., Middle East, 1/11. W. Gamblen (Quartermaster), to R.A.F. General Hospital, 'Iraq, 30/10. C. W. Coffey, to R.A.F. Base, Calshot, 6/12. R. Thorpe, to No. 1 School of T.T. (Apprentices), Halton, 9/12. W. Heron, M.B., to Station H.Q., North Weald, 6/12.

Flying Officers G. O. Williams, B.Sc., to Station H.Q., Upper Heyford, 9/12. D. D. Watson, M.B., to No. 5 F.T.S., Sealand, 9/12. W. J. Cotter, M.B., to Princess Mary's R.A.F. Hospital, Halton, 26/11. P. J. McNally, M.B., to H.Q., 'Iraq Command, 22/11. C. Crowley, M.B., to No. 14 Sqdn., Palestine, 29/10. J. Kemp, M.B., to R.A.F. General Hospital, 'Iraq, 30/10.

ACCOUNTANT BRANCH.—Flight Lieutenant E. W. Horncastle, to R.A.F. Depot, Uxbridge, 13/11. L. de L. Leder, to No. 4 F.T.S., Middle East, 19/11.

Flying Officer J. P. Cave, to No. 14 Sqdn., Palestine, 14/11.

The Cranwell Passing Out Inspection.

Air Vice-Marshal C. L. Lambe, C.B., C.M.G., D.S.O., Air Officer Commanding the Coastal Area, R.A.F., inspected the Royal Air Force Cadets at the Royal Air Force College, Cranwell, on Dec. 13 on the occasion of the Passing Out.

In the course of his Report, the Commandant, Air Vice-Marshal F. C. Halahan, C.M.G., C.B.E., D.S.O., M.V.O., said that there were 104 Flight Cadets under training. With the exception of one case of disobedience of Flying Orders, discipline had been very good.

FLYING TRAINING.

The total time flown by the Cadets during the last term had been 2,052 hours. The term now passing out consisted of 19 Cadets who had averaged 106 flying hours per head. This was the first time a term passing out had averaged over 100 hours' flying per head. This term had also produced the largest percentage of Fighter Pilots yet recorded, a total of 12 out of 19 Cadets.

GROUND TRAINING.

In English Literature and General History the term had left a record of uniform industry and progress over two years. This had been in part due to the example of its senior cadets who had shown that it was possible to achieve success simultaneously in flying, work and games.

The Cadets in all terms were working well and satisfactorily in Aeronautical Science but emphasis must again be laid on the importance of making full use of the time available for private study.

The Cadets had shown keenness and interest in Aeronautical Engineering. A visit had been paid by the Fourth Term to the Armstrong Whitworth Aircraft Works at Coventry, and this, thanks to the arrangements made by the firm, had proved both interesting and instructive.

THE SALUTE.—Air Vice-Marshal C. L. Lambe, C.B., C.M.G., D.S.O.—A.O.C. Coastal Area—taking the salute at the march-past of the Cadets of the R.A.F. College, Cranwell. On the left is Air Vice-Marshal F. C. Halahan, C.M.G., C.B.E., D.S.O., M.V.O., whose retirement from the Service at the end of this year is so much regretted by all those who have served with him, and by those past and present Cadets of the R.A.F. College whose Commandant he has been for three years.

Digitized by Google

In Armament the work on the whole had been good. The Cadets had shown keenness and attention to detail. For the first time the Rifle Association had given permission for the Fight Cadets to shoot in the Nobel Challenge Cup Competition and two teams would be entered.

The new Signals syllabus laid down by the Air Ministry would be in force next term.

Work in Air Pilotage had been satisfactory and the standard of cross-country flying had improved.

PARACHUTES.

Cadets of the Fouth Term had been instructed in parachute inspection, packing, method of jumping, and control when descending. No practice jumps had been made. A personal issue of parachutes had now been made to each Cadet and they hoped that Cadets would acquire the habit of taking proper care of their parachutes.

PHYSICAL TRAINING.

Thirty-three Cadets had been admitted to Hospital during the period under review compared with thirty-six between January and July. The interest in physical training had been keener and although the standard was good it could still be improved.

The foundations of the new College building were now nearly completed.

SPORTS.

Only one boxing contest had taken place during the term, against a team of R.A.F. Officers. The Cadets had lost by four fights to five. The high Rugby Football standard of the previous season had been maintained and the match against the R.M.A. had been drawn and that against the R.M.C. lost by a narrow margin. Of the twelve matches played eight had been won, three lost and one drawn.

The standard of skill-at-arms had been satisfactory in all weapons.

Seventeen Soccer matches had been played, of which seven had been won, nine lost and one drawn.

The College Beagles had provided consistently good sport.

In the inter-Squadron competitions, "B" Squadron had won the Rugger, the Soccer, and the Skill-at-arms.

AWARDS.

The Sword of Honour, presented to the best all-round Flight Cadet in the senior term, had been awarded to Flt. Cadet Under-Officer George Reginald Alexander Elsmie.

The R.M. Groves Memorial Prize for the best all-round pilot in the senior term had been awarded to Flt. Cadet Under-Officer G. R. A. Elsmie.

The Abdy Gerrard Fellowes Memorial Prize, for the Flight Cadet of the senior term obtaining the highest total marks in mathematics and science, had been awarded to Flt. Cadet Under-Officer G. R. A. Elsmie.

The Prize awarded to the Flight Cadet in the senior term obtaining the highest marks in Humanistic subjects had been won by Flt. Cadet Serjeant Richard Lindsay Wallace.

The Prize awarded to the Flight Cadet in the Senior term obtaining the highest marks in Aeronautical Engineering had been won by Flt. Cadet Corporal Alfred Earle.

The Air Estimates Programme.

In the House of Commons on Dec. 11 Capt. Bullock asked the Under-Secretary of State for Air whether this year's programme of seven new Squadrons for the Air Force was being carried out, and, if so, whether these seven squadrons were being properly equipped.

Mr. Montague said that the provision of two new flights for the Fleet Air Arm, which formed part of the programme, was being re-examined, but otherwise no change had been made in the programme, either as regards the formation of new units or the scale of their equipment.

[The Estimates in 1929 made provision for the addition during the financial year of one Regular Squadron, one Cadre Squadron, three Auxiliary Squadrons, two Flights for the Fleet Air Arm and one Unit of flying-boats. According to the current Air Force List, the additional units provided to date are one Cadre Squadron, one Fleet Fighter Flight, one Coast Defence co-operation Flight, and one Flying-Boat Squadron.—C. M. MCA.]

The West African Flight.

The annual Service Flight to West Africa from Egypt and back, which began at Helwan on Oct. 19, was successfully concluded when the Flight returned to Helwan on Nov. 29.

The flight was made by three Fairy IIIF machines (Napier Lion engine) of No. 45 (Bomber) Squadron under the command of Sq. Ldr. F. J. Vincent, D.F.C. The other personnel of the Flight were Flt. Lt. T. B. Prickman, Flg. Lt. R. C. Wilson, Sjt. Spillard, Sjt. Humphrey, and L/AC. W...

The Flight reached the following places on the dates mentioned:—

Khartum, Oct. 20; El Fasher, Oct. 22; Fort Lamy, Oct. ..; Kano, Oct. 24; Karsina, Oct. 28; Sokoto, Oct. 30; Kano, Nov. 1; Illorin, Nov. 5; Lagos, Nov. 6; Accra, Nov. 7; Tam.., Nov. 9; Accra, Nov. 11; Lagos, Nov. 13; Jos, Nov. 15; Ka.., Nov. 17; Yola, Nov. 20; El Fasher, Nov. 26; El Obeid and Khartum, Nov. 27; Atbara and Assuan, Nov. 28; Helw.., Nov. 29.

The High Speed Flight, R.A.F.

THE AEROPLANE learns from a reliable source that Officers Commanding Fighter Squadrons have been asked to recommend officers to fill three vacancies which will occur this year in the High Speed Flight, R.A.F.

The presumption is that the High Speed Flight, or to be perfectly accurate, the High Speed Flying Section of the Marine Aircraft Experimental Establishment, R.A.F., will be re-formed in 1930 at Felixstowe for the purpose of experimental work with high speed aircraft and, in the event of a change of attitude on the part of the Government towards the Schneider Trophy Contest, of forming the Unit to defend the Trophy.

The Singapore Base.

In the House of Commons on Dec. 11, in reply to Major Glyn, the Under-Secretary of State for Air said that the amount of money expended to date on the Air Base at Singapore was approximately £270,000, and the sum required for its completion £300,000. The facilities which were being provided would serve not only for local defence but also for the maintenance of British air communications in the Far East, and for the shore training and repair of equipment of air units allocated to naval forces in those waters.

The strength of the air forces which would be normally maintained at Singapore, as at present contemplated, was one Squadron of land machines and one Squadron of flying boats. These numbers were exclusive of any Fleet Air units which might from time to time be disembarked there.

No change in this part of the programme had been made as a result of the decision of the Admiralty to suspend further work on the Naval Base.

Parachutes for Sea-Going Aircraft.

In the House of Commons on Dec. 11, in reply to Capt. MacDonald (for Capt. Balfour), the Under-Secretary of State for Air said that parachutes were not yet adapted for use in sea-going aircraft and flying-boats, nor were they compulsory equipment for pilots and crews of such craft. A good deal of difficulty had been experienced in devising a form of quick-release gear which would enable the wearer to free himself from the parachute harness if he fell into the water and would also comply with the other special requirements for sea-going aircraft. A new form of such gear was under trial at present and he hoped that it would prove satisfactory.

The New Auxiliary Squadrons.

The three new Squadrons of the Auxiliary Air Force which will be formed before the end of the current financial year will be named and numbered as follows:—

No. 604 (County of Middlesex) Squadron; No. 607 (County of Yorkshire) Squadron; No. 608 (County of Durham) Squadron.

LEAVING HOME.—The R.A.F. Fairey Long Distance Monoplane (530 h.p. Napier Lion engine) being hauled out of its shed at Northolt to get ready for the attempt on the World's Long Distance Record.

The engines of

R 100

are fitted with

LODGE

PLUGS

Lodge Aviation plugs are the outcome of more than twenty years' experience in the manufacture of ignition plugs for all types of internal combustion engines.

A characteristic of these plugs is that they will withstand overheating of the engine for short periods without detriment.

The patented construction incorporated in the A30 and A40 designs gives a wider range of resistance to heat and oil than is obtainable in any other make of plug.

The Long Distance Attempt.

The R.A.F. Fairey Long Range Monoplane (Napier Lion engine) left Cranwell, Lincolnshire, at 07.58 hours on Dec. 17, piloted by Sq. Ldr. A. G. Jones-Williams, M.C., with Flt. Lt. H. N. Jenkins, O.B.E., D.F.C., D.S.M., as second pilot, in an attempt to fly non-stop to Cape Town and to break the present World's Long Distance Record of 4,912 miles, made by Costes and Bellonte in their voyage to Manchuria.

The route of the flight crosses France to Marseilles and goes thence to a point on the North African coast near Tunis. It crosses the Sahara and then runs parallel with the West African coast inland.

In order to beat the existing record under the F.A.I. regulations, the machine must fly at least 100 kilometres (62.14 miles) more than the present figures, so that the British pilots must fly a minimum of 4,975 miles, measured on a great circle course, to secure the record for Britain. This means that they must reach a point in South West Africa, about 30 miles south of the Cunene River and about half way between Benguella and Walfisch Bay.

The range of the Fairey monoplane with full load is thought to be about 5,500 miles.

The aircraft has been thoroughly overhauled since the India flight but the only structural alteration of importance to the machine has been to fit a new fin and rudder to give greater stability in bumpy weather.

Various modifications have been made in the cabin. The pilot's seat has been altered so that it can be raised or lowered about 6 in. and the back is hinged so that the angle of the upright portion can be moved to ensure the greatest comfort for the pilot.

The rudder bar has now been fitted with whole footplates, lined with sorbo, in place of the pedals previously installed.

The pneumatic bed has been taken out and replaced by a deck lounge chair, with padded neck and knee rests, which the second pilot can use for sleeping or for working at navigation or other duties.

The aircraft is fitted for this flight with a short-wave wireless transmitting set, and will transmit routine reports giving its position every four hours—at 08.00 (G.M.T.), 12.00 (G.M.T.), and so on throughout the period of the flight. The call sign is GEZAA. It will transmit on 33.71 metres. It is not equipped to receive messages during flight; private wireless stations are therefore asked to refrain from transmitting on this wavelength as they are liable to cause jamming and may thus prevent the reception of an urgent message.

The Air Ministry has arranged for the wireless stations at Malta, Ismailia, Aden and other stations to the South to keep special watch for signals from the aircraft, but it will be glad to have authentic reports passed to it which may be picked up by private stations abroad.

The machine took off the prepared runway at Cranwell with full load, approximately 17,000 lbs.

The machine passed Nevers in France at 12.00 hours on Dec. 17.

The High Commissioner for 'Iraq.

Sir Francis Humphreys, the new British High Commissioner for 'Iraq, accompanied by his wife and daughter, flew in a Royal Air Force troop-carrying machine from Palestine to Baghdad on Dec. 10. The machine was escorted during part of the journey by a Squadron of the R.A.F.

Sir Francis Humphreys, who was British Minister in Kabul during the evacuations by air last December and January, served in the R.A.F. during the War 1914-18.

THE PILOTS.—Sq. Ldr. A. G. Jones-Williams, M.C., R.A.F. (right), the first pilot of the Fairey Long Range Monoplane, and Flt. Lt. H. N. Jenkins, O.B.E., D.F.C., D.S.M., R.A.F. (left), the second pilot, who left Cranwell on Dec. 17 in an attempt to beat the World's Long Distance Record.—(*"Aeroplane" photograph.*)

The Elliot Memorial Prize.

The Elliot Memorial Prize, which is a sum of five guineas awarded annually by the Royal Aeronautical Society in memory of the late Mr. A. B. Elliot (Sir Alan Cobham's mechanic, who was shot by an Arab during a flight in Southern 'Iraq in 1926 and died in Basrah), for a paper written by an aircraft apprentice under training at Halton, has been won this year by AA. A. Armstrong and AA. E. H. Lanham.

Central Flying School Categories.

The following officers have been re-categorised as stated from the dates following their names:—

A.2 to A.1.—Flt. Lt. V. B. Bennett (Oct. 29, 1929).

B.2 to A.2.—Flt. Lt. C. R. Davidson, M.C. (Nov. 18, 1929); Flg. Off. A. R. Leslie-Melville (Nov. 8, 1929); Flg. Off. G. A. V. Tyson (Nov. 16, 1929); Flg. Off. L. C. Barling (Nov. 16, 1929).

THE FIRST STAGE.—The Fairey Long Range Monoplane (530 Napier Lion engine) leaving Northolt for Cranwell for the final trials before starting on the non-stop flight to Cape Town.—(*"Aeroplane" photograph.*)

The following officers have been categorised as Flying Instructors from the dates following their names:—

A.1.—Flt. Lt. G. H. Martingell (Nov. 18, 1929).

B.—Flt. Lt. R. E. M. B. Milne (Nov. 18, 1929); Flt. Lt. J. MacG. Fairweather, D.F.C. (Nov. 18, 1929).

The R.A.F. Club.

The Royal Air Force Club will be closed from 14.30 hours on Dec. 27 until 12.30 hours on Dec. 28 (for the purpose of holding the Annual Staff Dance), except in so far as affects bedroom accommodation (with breakfasts only) to Residents and Members who have engaged bedrooms prior to 12.00 hours on Dec. 27. The Club will remain open during the Christmas Holidays.

No. 3 Squadron Re-Union.

The tenth annual re-union dinner of No. 3 Squadron, R.F.C., and No. 3 (Fighter) Squadron, R.A.F., was held on Dec. 6 at the Hotel Cecil.

Air Chief Marshal Sir John Salmond, K.C.B., C.M.G., C.V.O., D.S.O., A.D.C., was in the Chair, and Air Vice-Marshal C. A. H. Longcroft, C.B., C.M.G., D.S.O., A.F.C. was the Guest of Honour of the evening.

Thirty-nine past and present members of the Squadron were at the dinner. It was a very rough night—meteorologically of course—and this probably accounts for there being eleven empty seats.

Speeches were made by Air Chief Marshal Sir John Salmond, Air Vice-Marshal Longcroft, and by Sq. Ldr. E. Digby-Johnson, the present Commanding Officer of the Squadron.

An impromptu concert was held after dinner, which went on till midnight, when the party reluctantly broke up.

A Medical Branch Dinner.

The Royal Air Force Medical Branch held their ninth annual dinner at the Hotel Cecil on Dec. 13. The Guests were Mr. W. Girling Ball and Dr. A. M. Gray. Air Vice-Marshal D. Munro and seventy-five other officers of the R.A.F. Medical Branch were present.

THE SITUATION IN THE MIDDLE EAST.

A lecture on The Situation in the Middle East was given by Sir E. Denison Ross, C.I.E., Ph.D., at the Royal United Service Institution on Dec. 11. Major-General Sir Percy Cox, G.C.M.G., G.C.I.E., K.C.S.I., formerly High Commissioner for 'Iraq, was in the Chair.

Although Sir Denison Ross said very little about aviation, the Lecture was of particular interest to the R.A.F., most of whom have served, are serving, or will serve in the Middle East.

Sir Percy Cox said that the Lecturer had been for fifteen years Director of Oriental Studies at the London University. He was the foremost Oriental scholar of our time and was, in addition, a great traveller.

Sir Denison Ross said that events moved so rapidly in the East in these days that the situation was already much changed since he was there at the beginning of the present year. The greatest of all the questions in the World to-day was the question of East and West. Since the War the whole map of the Middle East had been altered.

The general policy had been the dismemberment of the Ottoman Empire. Egypt, Syria, 'Iraq, Palestine and Arabia had been part of the Turkish Empire for many years. Arabia had become independent, Egypt partially independent, 'Iraq and Palestine had been handed over to Great Britain by mandate, and Syria had been handed over to France by mandate. The various mandated territories had come into being in much the same way as various countries had come into being with the dismemberment of Austria-Hungary.

'Iraq, Syria and Transjordan had passed with one bound from the caravan stage of development to the stage of the most modern methods of transport.

The Lecturer said that he did not believe in the dissolution of Islam or that any of the great religions would ever die. The new Wahabi ruler of Arabia had shown a strong reaction in the direction of puritan Islam. Ivn Saud, the strictest Moslem of the strictest sect, had no prejudice against modern transport and even allowed pilgrims to go by motor-car as far as the outskirts of Mecca. A great deal of delay in the development of these countries had been caused by the change in the language from Turkish to Arabic.

Ibn Saud was having a very difficult time in Mecca, but he was one of the greatest men Arabia had ever produced.

'Iraq was another newly-founded state and could almost be described as a nation in the making. At present it was ill-provided with capable officials of its own nationality. On the military side the integrity of the country had depended in the past and still depended on our splendid Royal Air Force with its Headquarters at Hinaidi and its armoured cars. The sight of the machines overhead and the armoured-cars patrolling the desert was of the greatest support and comfort to those who were working to make the country peaceful and prosperous.

Internal order was adequately maintained by smart, well-mounted and efficient gendarmerie recruited from the old Syrian regiments.

Such good progress had been made in 'Iraq that we were strongly supporting their claim to be admitted to the League of Nations next September. When the mandate was withdrawn the 'Iraq Government would still require our help, although those who stayed in the country would become the servants of the 'Iraq Government instead of being British officials. King Faisal had shouldered his many responsibilities splendidly in every way and was every inch a King.

When the Lecturer was in Palestine about nine months ago the situation had appeared very peaceful, but since then trouble had developed between the Arabs and the Jews, and it once more appeared that the country could not be ruled without soldiers.

In Syria the French had to maintain many thousands of soldiers in order to keep the peace.

In Egypt the situation changed from day to day. He hoped that the new British representative there would have the full support of the Foreign Office. With regard to the new Treaty with Egypt, its terms were so liberal that it was quite possible that it might not be rejected.

King Fuad was a remarkable personality. If he remained King he would do a great deal for his country. If the country's aim was peace and prosperity then it must have a strong garrison at Cairo. Egypt did not like the British garrison being in Cairo, but she had yet to prove that she could maintain law and order without them. It was many centuries since Egypt had walked alone.

There existed in Egypt a responsible middle-class which was incapable of realising that the Pyramids were not built in a day. We should not have to be in Egypt if the route to India still ran round the Cape.

The principal changes in Persia had been caused by the progress in locomotion. Thirty years ago there was one carriage road from Kazvin to Teheran. To-day there were motors on roads all over the country. There was also an excellent Junkers air line to Teheran, a line which he understood had not had one single breakdown since it came into operation.

He was glad to say that there was no change in the Persian people themselves, who were some of the most charming people in the world. The Shah was a strong ruler, and his object was to bring about reforms in his country without interference from foreign Powers. Persia was the only country in the Middle East to retain her pre-War frontiers. She was making slow progress, but at least she was attempting to work out her own salvation.

Speaking of Great Britain's role in the East, Sir Denison Ross sketched an outline of the origin of our commitments. He explained that from the beginning of the 16th Century the merchandise of the East had been taken to the seaports of the Mediterranean and there shipped to Europe by Europeans. At that time Europeans had no interest beyond the actual ports. Later on the ships were built in the Mediterranean ports from wood brought from Cyprus and other islands to Suez.

When the Portuguese had discovered the all-sea route to India it had become necessary to protect the routes. Factories (*i.e.* trading-stations, not manufactories) had been established by English merchants and the Powers had begun to establish territorial rights. Malta had been acquired to keep the route free to India. England then began to take an intense interest in the Government of Egypt.

Regarding what he called "the morality of exercising control in Egypt," the Lecturer said that our commitments were absolutely necessary and had arisen from the paramount necessity of keeping a free flow of commerce from East to West. He referred to "that self-determination, of which we have heard so much and seen so little."

Discussing the reasons why the East had been left behind in progress, the Lecturer said that the East was handicapped by the tyranny of tradition, the tyranny of the sun and a lack of initiative in Science and Economics. The mental progress of the Oriental was arrested because of his religion.

One of the chief blessings of the West was its temperate climate. You could reduce the risks of malaria and protect from the rays of the sun but you could not get away from the debilitating effects of a tropical Summer. The East had started first, but had been left behind. It had made no progress in science and economics but only in the arts. The builders of the Mosque of Omar and the Alhambra had been unable to draw an intelligible map.

The ideal government for the East was that of a good despot, but the East desired Western institutions without Western guidance. While despising Western culture they wished to adopt those features of Western civilisation which made for progress and independence.

In thanking the Lecturer, Sir Percy Cox said that we could not force our assistance on any of these young Nations. We must let them play their own hand, and then when they failed, they would come back to us for help—

THE LAUNCHING OF R.100.

On Dec. 16 R.100 left her shed at Howden at 07.56 hrs. Soon after 09.00 hrs. a small group of optimists gathered at Cardington to welcome the ship after her first voyage. As time passed people who were less optimistic and therefore left home later came along, so by 11.15 hrs. when the airship came into sight, there was a goodly crowd.

The weather was perfect with a 10 m.p.h., but rather unsteady, N.W. wind. R.100 cruised round, made preliminary tests of controls and showed that she had a good turn of speed.

It was noticeable that the fabric of the aft part of the hull and bottom fin pulsated considerably in the slipstream of the airscrews.

The low winter sun cast long shadows on the fabric showing how it presses inwards against the frames, unlike R.101, in which the fabric is kept out by air pressure.

The ship was flying light and keeping down to about 1,500 ft. by dynamic depression which made her fly slightly nose down.

At 12.15 hrs. the mooring coupling was dropped, and linked to the cable from the Tower. Mooring operations began by the ship rising to about 2,000 ft. which was especially necessary because the wind was flukey and too light for easy mooring. At 13.00 hrs. all the slack was taken up and she was drawn down. The side-guys were lowered when about 200 ft. above the mast.

The usual three-cable mooring was made without any hitch and the locking pins were screwed home 50 minutes after the start of operations.

The gangway was lowered and Major Scott and Commander Sir Dennistoun Burney came down the lift.

Major Scott said that the ship handled differently from R.101 but was just as easy to control. The controls were just as light and there was the added advantage that the engines could be throttled down to a slower speed.

When coming up to the mast the two rear airscrews of the forward cars were running reversed and one airscrew in the aft car was running ahead. Manœuvring was done by the engine throttles.

When asked about the flight Major Scott said that he had flown at 1,800 ft., that there was a great deal of mist, and so the ground could not be seen at intervals. The speed of 70 m.p.h. was easily maintained as a cruising speed. In fact his description of the flight was that all was just as it should be.

Commander Burney, with his usual smile, said that the voyage accorded with the views expressed in his book, "The World, the Air, and the Future."

On Dec. 18 R.100 is to start her trials, which will be similar to those of R.101.

Of course there will be minor alterations and adjustments to be made to this ship just as there have been to R.101, but if the first day's performance is any indication of the future, there can be no doubt that the nation has two of the best airships possible at the present day. Let us hope that real use will be made of them to settle the question, Are we to have Airships or no Airships in the future?—L. HOWARD FLANDERS.

Commander Burney, as the organiser of the great scheme under which R.100 was built, and Mr. V. N. Wallis, as the designer of the ship, deserve the highest praise for the remarkable success of this first flight. And not less credit is due to Vickers Ltd. for having staked their faith on the building of this ship at a time when the finances of every great engineering firm in this country were in a state which at best can only be described as delicate.

Though in a general way the structure of R.100 resembles the Zeppelin principle of construction more than does R.101 nevertheless she is full of new and clever notions, for all of which Mr. Wallis, the chief engineer, is responsible. Many of the most vital of these details are definitely his own inventions, such as the idea of making a mass-production job of one single ship by the ingenious process of using the same component unit multiplied over and over again for the major parts of the whole ship.

Mr. Wallis is recognised as being one of the cleverest engineering designers in this country. And, even if the Government should mistakenly decide not to build any more airships, the genius of Mr. Wallis is sure to be well employed in the design of heavier-than-air craft. Nevertheless, those who believe that airships have their own particular part to play in the development of air transport will hope that he may continue in this special branch for which he has shown such outstanding aptitude.

Likewise, all will hope that Commander Burney's determination and energy and initiative, which enabled him to carry through such a difficult scheme as the financing and construction of R.100 will again find support, so that he may go on constructing yet other ships.

Nobody who believes in airships is so foolish as to think that R.100 is not going to meet with mishaps of one kind or another. And nobody knows better than the designers and constructors how easily the designs of R.100 could be improved in another ship. In fact one has good reason for saying that R.100 could have been out several months ago but for the fact that so many alterations were made simply because so many possibilities for improvement were discovered while she was being built.

As is well known, the Goodyear Zeppelin Co. in the States are building two ships, each with a capacity of 6,500,000 cubic feet, as against the 5,000,000 of R.100 and R.101. Therefore obviously this country must proceed at once with the design of new airships to compete with the big American ships.

Our next ships need not necessarily be any bigger than our two new ships. All we have to do is to produce something very much better in construction and performance than the American ships. And with the experience which we have gained, and with the brains which we have available, we certainly can produce such ships. But, if we are to get the best results from them, work must begin at once, and we must not wait till the American ships come out and beat our existing ships.—For by then all our experienced airship designers and workers will have been dispersed into other trades and we shall have to start work all over again.

—C. G. G.

R.101 in the House of Commons.

In the House of Commons on Dec. 11 Major Church asked the Under-Secretary of State for Air what facilities, if any, existed for training the necessary personnel in the use of engines of the type carried by the airship R.101, other than those actually in use on the R.101.

Mr. Montague said that the engineer crew of R.101 con-

JUST OUT.—R.100 at Howden, seen from below, rudely dropping water-ballast on the crowd.

sisted at present of three watches of men who had been trained in the use of the engines both at the makers' works and in the airship.

Replying to a further question by Major Church, Mr. Montague said that the crew personnel was recruited on a full three-watch basis before the recent flying operations began, and there were three officers available for duty. Further operational experience was necessary before the numbers required could be finally settled.

In reply to a question by Sir N. Grattan-Doyle, Mr. Montague said that the R.101 would remain in the shed while the R.100 was at the only available mooring mast. During this period certain modifications would be made which might require some time for their completion. Apart from the cost of these modifications, maintenance charges would be negligible, as the crew would be usefully employed.

[Apparently the gas-bags will be, or have been, de-flated, and the gas stored for future use.—ED.]

The R.100 in Another Place.

In the House of Lords on Dec. 11 the Marquess of Londonderry asked the Government whether they could give any information regarding the tests of the airship R.100.

Lord Thomson replied that three sets of tests had to be carried out. One set had already been carried out—the shed trials—and the other two sets had not been carried out because R.100 had never been taken out of her shed. The reason for this was that the shed fitted very closely to the ship, and to get it out demanded a flat calm. This, however, was not the permanent shed for R.100. There were two sheds at Cardington, and it would be possible to get R.100 in and out without the same difficulty. At Cardington they also had the mast. He could give no information about future tests of R.100 until she had gone through the second set, which consisted of four flying trials, increasing from not less than three hours to not less than 48 hours' flight.

AN AIRSHIP MAST FOR NEW YORK.

The tallest-to-be skyscraper is now being erected in New York on the site of the old Waldorf-Astoria Hotel. The new edifice, the instigator of which is Al. Smith, the Catholic drinker who nearly became president, will be known as the Empire State Building, and will be 1,100 feet high.

On top of this the owners intend to build a 200 feet mooring mast for airships, so that the total height of the structure will be 1,300 ft. above the street. This mast will be designed to hold airships of the largest size in anything up to a 50 m.p.h. gale.

This sounds at first a reasonable proposition. Presumably American airships will be safe from fire as they are filled with helium. The airship terminal will be right in the middle of the City, where it is wanted. And the airship will be floating in more or less uniformly behaving air 1,200 feet above ground level.

But one wonders how the mooring rope from the airship will be picked up and connected to the rope from the mast. Perhaps a special squad of roof-clamberers and chimney-climbers will be detailed to chase the trailing pennant over the roofs of New York.

[Also, having no tail-anchorage, the ship may plunge up and down till it wipes its tail off on a not-so-much-lower building, for the air out of and into and over and round those cañons and peaks which are New York streets is probably more disturbed at 1,200 feet than any air in the World.—What with the frost in Wall Street and the hot-air of Times Square it must be worse than the Greek coast. So one does not think much of the idea.—ED.]

AN ACCIDENT IN AUCKLAND HARBOUR.

A Dornier Libelle flying-boat fell into the sea in Auckland Harbour, N.Z., on Dec. 12. The pilot, Capt. D. F. Harkness, and the mechanic, Mr. C. F. Goldsboro, were both killed.

Captain Harkness was a lecturer in civil engineering at Auckland University College. During the War 1914-18 he was in the R.A.F. and won the D.S.C.

SIR ALAN COBHAM'S VOYAGE.

Sir Alan Cobham left Croydon for Broken Hill, Rhodesia, on Dec. 11 at 10.20 hrs. He reached Paris two hours later, and after a halt of two hours flew on to Dijon.

On Dec. 12 he reached Rome by way of Marseilles, and on Dec. 14 he reached Tunis, whence he left for Tripoli on Dec. 15.

THE DEATH OF A PIONEER.

M. Rougerie, the director of the Farman Aerodrome at Villacoublay, was killed on Dec. 12 while talking to M. Maurice Farman. The roof of a hangar was blown off by the gale and a heavy door fell on M. Rougerie. M. Farman was not hurt.

M. Rougerie learned to fly in 1911 and had been interested in Aviation ever since. Recently he has created a school for "blind-flying" which is likely to prove of great value.

A FORD-JUNKERS ARGUMENT.

The Madrid correspondent of *The Times* reports that the company which controls the Spanish air lines recently bought a Ford Trimotor for use on the Madrid-Seville service. The machine was expected to arrive in Madrid on the 15th on its first flight with passengers.

The Junkers Company, which has also supplied aeroplanes to the Spanish company, has entered a protest against the introduction into Spain of the Ford aeroplane, which, it alleges, infringes Junkers patent rights, and the Junkers Company is endeavouring to lay an embargo on it.

The Spanish company, without prejudice to whatever the Spanish Courts may decide as to the validity of the Junkers claim to patent rights, is determined meanwhile to put the aeroplane into service.

MIAMI—BUENOS AIRES.

On Dec. 15 a Pan-American Airway's machine left Miami (Florida) for Buenos Aires by way of the East Coast of S. America. At least, so the New York correspondent of *The Times* says. One feels a little uncertain about the machine flying all the way to Buenos Aires, as one had always understood that the various sections of the route were flown over by different types of machines.

The real news is that Pan-American Airways, who hitherto have only flown to Paramaribo, Dutch Guiana, are now continuing the route right down to Buenos Aires, where they will link up with their other route, which goes down the Pacific Coast to Chile and thence across the Andes.

One does not quite understand how this will affect the New York, Rio, Buenos Aires line, commonly known as the N.Y.R.B.A. line, which has a mail contract with the Brazilian Government for the transport of mail northwards.

PILOTAGE IN BRITISH COLUMBIA.

On Oct. 26, the Air Pilots', Engineers and Navigators' Association of British Columbia was formed in Vancouver, B.C. The first directors of the organisation are Mr. E. J. A. Burke, Mr. A. H. Wilson, Mr. J. C. Ballard, Mr. T. E. Snelgrove and Mr. George Silk.

The Association, whose function is similar to that of the British Guild of Air Pilots and Navigators, aims to promote and maintain high standards of ethics and efficiency in the several professions of its members and to provide an organisation whereby its members may work together in the interests of their professions and of aviation in general.

NEXT FRIDAY.

Any reader of THE AEROPLANE in London on Friday next who has not already fixed a date, will do well to go to the Wigmore Hall, Wigmore Street, and hear Sir Philip Sassoon's lecture on "The Third Route." This is bound to be one of the most interesting aeronautical lectures of the year, and as the proceeds will go to the Great Northern Hospital, those who go to the lecture will know that they are spending their money in a good cause as well as assuring themselves of a pleasant hour or two.

ENTERPRISE IN THE DOMINIONS.—The new De Havilland Factory in Canada seen from the Aerodrome.

THE DE HAVILLAND PARTY.

On Saturday, Dec. 14, the De Havilland Aircraft Co. Ltd. had their Annual Staff Party at the Wharncliffe Rooms. There were somewhere between three hundred and four hundred people present,—all, if possible, more enthusiastic than they were at the firm's party the year before. Mr. Alan Butler, Chairman of Directors, presided, with his co-directors, Capt. Geoffrey de Havilland, Mr. Charles Walker, and Mr. T. P. Mills in support. After dinner there were a few speeches which, because of their historic value, deserve to be reported.

MR. RONALD MALCOLM, proposing the toast of "The Directors," said that the competence of the Directors and the enthusiasm of the staff accounted for the firm's remarkable successes. This was greatly aided by the fact that two World's Records were held by directors of the firm, Mr. Butler and Capt. de Havilland. He held up the De Havilland Company as example of progressiveness.

MR. ALAN BUTLER thanked those present for the warm reception they had given to the toast. He said that since last year the firm had been made into a public company so he could not give quite as much information this year as he had done at the dinner last year, because the Annual General Meeting of the firm had not yet been held.

He said that in the past the marketing of their products had been hard. There had been a prejudice against flying. But this had been got over by the enthusiasm of everybody in the firm. The result was that this year the firm's sales were 75 per cent. up, and the sales of Moths alone was 100 per cent. up.

Like all trades, the aircraft trade suffered from seasonal depressions, but the world-wide distribution of their sales got over that to a great extent.

The Gipsy engine was going ahead well. Major Halford, its designer, might well be proud of it, especially of the record of the "sealed engine," which had done 600 hours' flying, which was equal to flying twice round the world, without anything inside being touched. He added that many firms outside of their own firm were considering fitting Gipsy engines.

As an example of the De Havilland method of discovering the needs of the World market, he said that Hawk Moths were being flown experimentally in Canada and in Australia to see how they suited the conditions of those countries.

Referring to new types, Mr. Butler said that he had done a good deal of flying in the firm's latest light aeroplane, the Puss-Moth (otherwise the D.H.80). It gave him an entirely different outlook on flying.

[So many people, foreigners as well as English people, have seen the Puss-Moth that one is giving away no secrets when one lets the rest of the World know that it is a cabin monoplane with an inverted Gipsy engine. It gives the pilot a clear view in almost every direction and it has an extraordinary performance.]

Mr. Butler also referred to a bigger machine which the firm has recently built, but as it is on the secret list it must not be described. He did however say that its performance exceeded expectations and that it handled like a Moth.

On the strength of these products Mr. Butler said that he hoped that the D.H. Company would be able to beat all its competitors.

Continuing, he said that the School had exceeded the amount of flying that it had done last year and had turned out more pilots. In Australia their branch firm was doing well. Their Canadian branch was now a public company largely financed with Canadian money, but under English control. New works had been built in Canada and prospects were very good.

In the United States, he said, the Wright Corporation were turning out Gipsy engines, and the American Moth Corporation had been taken over by the Curtiss-Wright Group, which was the biggest aeronautical concern in the States.

The latest link in the Empire chain was the opening of a branch in India in charge of Wing Commander Crosbie. And he said that it was up to them all to extend this chain all over the world.

He then read cables from the Australian, Canadian, and Indian branches wishing everybody a pleasant evening and future success to the firm.

Thereafter Mr. Butler exhorted all members of the firm to strive to reduce costs and to improve the firm's products, because they were now entering a period of intense competition. Referring to future improvements, he said that aircraft constructors must have greater freedom in design,—implying that official restriction and supervision of design should be slackened,—and he argued that the D.H. firm's reputation was a strong weapon in obtaining such greater freedom.

Turning to domestic affairs, he said that the amount of money in the Superannuation Fund was double that of last year, and that the finances of the Sick Club were progressing well. He thanked those responsible for the organisation of the sports ground.

He then read a list of the firm's successes in public competition, which was truly formidable. These included second, third, and fourth places in the King's Cup Race; the first to the sixth place inclusive in the Siddeley Trophy Competition; Mr. Broad's victory in the large class in the European Tour, coupled with second place in the general classification; Mr. Broad's winning of the Zenith Cup Contest, a full-throttle flight of 1,100 miles; the winning of the Grosvenor Cup; the winning of the first prize at Rotterdam; the South African Derby; a number of races in Canada; and fastest time in the Australian trans-Continental race from Sydney to Perth.

CAPTAIN GEOFFREY DE HAVILLAND, proposing the toast of the Staff and the Workshop Personnel, said that the success of the firm was due to every member of the staff. Every department had put up a fine show. And he thanked them all.

MR. F. T. HEARLE, Works Manager, supporting the toast, said that nobody realised better than he did the individual efforts which all had made. Only by such team-work and spirit could the firm keep its end up.

In a way, he said, the firm suffered from the excellence of the work done in their factory. There were not enough properly trained

THE DE HAVILLAND AIRCRAFT OF CANADA.—The works seen from the road.

Digitized by Google

CANADIAN DE HAVILLANDS.—In the Machine-shop.

people in the Aircraft Industry to fill jobs when the boom in aircraft came, so newcomers to the trade naturally came to Stag Lane to get people who knew their jobs.

To cope with the demand for trained people they had recently started a regular educational section. Mr. Eadon had done particularly good work in training ground engineers.

In conclusion he said that he wanted everyone in the firm to help in entertaining visitors to Stag Lane, whether they were owners of De Havilland machines, or prospective owners, or merely students of aviation, or even foreign competitors. They wanted everybody who came to Stag Lane to come again, for they wanted everybody to say, after having been there: "A damn good crowd, de Havilland's." [There is no need for Mr. Hearle to want people to view the D.H. firm in this light. That is exactly what everybody does already. For anybody concerned with British Aviation a visit to Stag Lane in the most depressing weather is the best possible cure for depression. Whether in the offices or the workshops everybody is obviously full out and there is always an inspiriting atmosphere of optimism. Everybody is busy and yet there is always somebody of importance who can spare time to show visitors round the place. And there is an openness about the way things are shown to visitors which is generally only met in America. Probably that is why our American visitors always think so very highly of the De Havilland Company.]

MR. RADFORD, replying on behalf of the Personnel, said that after all that had been said about them they were beginning to think that they must be quite an important body of people. They appreciated these gatherings very much, for this was the only time when they were able to learn whether they were giving satisfaction. He assured the directors that the whole staff were there to pull their weight in the boat and to make good profits for everybody.

He referred admiringly to Mr. Butler's flight across the Channel in the gale on Saturday Dec. 7, when Mr. and Mrs. Butler and Mr. and Mrs. Norman were the only human beings to cross the Channel on that day. Referring to the ultimate object of this great flight, he remarked that some people in Paris after the Big Fight that night, had to walk home because "there was no car nearer."

Discussing the internal affairs of the firm Mr. Radford said that in the past year 72 new members had joined the Superannuation Fund, and he thanked Mr. Mills on behalf of the fund for his handsome gift of £50. By way of describing the enthusiasm of the personnel of the firm he said how unlike they were to those in a certain workshop full of men in which a visitor asked his guide "How many men work here?" to which the guide replied, "About one in ten.

MR. W. E. NIXON, Secretary to the firm, briefly proposed the toast of "The Guests."

MR. R. C. N. NEWPORT, Borough Surveyor for the Edgware Council, claimed that nobody in the room had had longer business relations with the firm than he had. He remembered that in 1920 they only had 50 employees, and now the number ran into four figures. They had achieved their success entirely by hearty co-operation. He said that in the course of his duties he visited a large number of factories, but he knew none in which the Directors did more for the social good of the employees.

After that quite a good concert party occupied the platform in the middle of the room. But there seemed to be amateur concert parties at each end of the room as well, and general conversation all over it. So there was some little doubt whether the conversation interfered with the concert or whether the concert interfered with the conversation.

Still everybody enjoyed themselves immensely. And so far as the music is concerned, one merely throws out the suggestion that next year the organisers of the party should content themselves with a band of tom-toms and Jew's harps, merely to keep the conversation going.—C. G. G.

DESOUTTERS OVERSEAS.

That enterprising firm, the Desoutter Aircraft Co. Ltd., is wisely turning its attention to the Overseas market and is evidently not staking its future on the home market. Agencies for the Desoutter Sports Coupé (Cirrus-Hermes) have already been fixed for Australia and New Zealand, among the British Dominions, and for the Argentine and Uruguay among the South American nations. In each case a definite order for machines has been placed, so these are not paper agencies of the kind which so often kill British trade.

The firm has a number of inquiries for agencies and for manufacturing rights from various parts of the world. Altogether the Desoutter Sports Coupé looks like being one of the most popular aeroplanes in the World next year.

THE LAST ISSUE OF THE YEAR.

Readers of THE AEROPLANE who are not regular subscribers are reminded that they should order the next issue of THE AEROPLANE, dated Dec. 25, at once. It will be the last issue of this year and will be of unusual importance. The first article will be devoted to a review of the development of the Royal Air Force from the Royal Flying Corps, under Sir Hugh Trenchard, who vacates the office of Chief of the Air Staff on Dec. 31. And the Engineering Supplement will have a particularly interesting article by Mr. R. J. Mitchell, designer of the Schneider Trophy winner, on the Effect of High Speed Flying on the Design of Aircraft.

FAIREY PROGRESS.

The first report of the Fairey Aviation Company, formed in March of this year to acquire the business of the Fairey Aircraft Holdings Company, covers to September 30.

The trading profit of £164,954 is practically that estimated when the shares were put on the London Stock Exchange. It is an advance of £4,762 on the profits for the previous complete year ending in March 1928.

A sum of £56,625 (the profit prior to incorporation) is transferred to capital reserve, leaving £108,329, of which £33,000 is placed to income-tax reserve and £15,425 to reserve for patents.

A dividend of 7 per cent. is recommended on the £500,000 share capital.

Preliminary expenses, share issue expenses, and debenture discount are to be written off from capital reserve, and the balance of £24,575 transferred to reserve for patents.

Mr. C. R. Fairey is chairman and managing director.

THE WESTLAND SOCIAL EVENING.

On Dec. 7 the employees of the Westland Aircraft Works foregathered at the Yeovil Town Hall for a Social Evening. Mr. R. A. Bruce, Managing Director, and Mrs. Bruce were accompanied on the platform for the opening speeches by Mr. Gibson (Works Manager), Mr. Gaunt (Secretary of the Westland Aircraft Society, the Yeovil branch of the Royal Aeronautical Society), Mr. Davenport (Chief Designer), Flt. Lt. Paget (Chief Pilot), Mr. McLean (Contracts and Buying), Messrs. Norton and Watts (A.I.D.) and Messrs. Fitcher, Swetman, Dalwood, Carey, Rowe, Cook, Lower, Pomeroy, Nicholls, Millman and Goswell.

Mr. Bruce said that this was the first occasion of its kind which was devoted entirely to the Westland Aircraft Works (The Westland Works is a branch of Petters Ltd., the well-known Oil Engine Manufacturers) and he hoped it would prove a great success. It was gratifying to him to see the progress which had been made since the early days when the Westland Aircraft Works was started in the early part of the War, in 1915. In those days he himself with Mr. Davenport would lay out the fuselages.

He was glad to see a few of the oldest hands still with the firm—he saw Mr. Davenport, Mr. McLean, Mr. Dalwood and one or two others who had been with him from the start. He felt that everyone had a great interest in the products of the firm—he personally felt privileged to be engaged in work of such absorbing interest. They all had dull tasks at times, but even the office boys and typists would feel that they were privileged in working at the production of machines of such scientific and general interest.

Referring to the Westland Aircraft Society, he said that he considered this useful ground on which they could meet and learn of the developments in aeronautics, and the meetings were a valuable means of increasing the knowledge of all members. From this aspect the Society was very helpful, and he hoped everybody would join. He would ask them to drink to the health of the Westland Works.

The toast was drunk with enthusiasm, followed by a toast to Mr. and Mrs. Bruce, with musical honours. Mr. Bruce replied with a toast to the employees, and the musical programme then proceeded. After turns by local artists the floor was cleared for dancing, which lasted until midnight.

THE WESTLAND AIRCRAFT SOCIETY.

The Westland Aircraft Society, which is the Yeovil Branch of the Royal Aeronautical Society, is becoming widely known through the excellence of the lectures read before. A number have been published in THE AEROPLANE.

This Society should evidently be a valuable focus of air-mindedness in the West Country, for one gathers from the rules that although intended primarily for employees of Petters Ltd., other persons can become members.

Among the lectures scheduled for the New Year are an instructional film on machine tools; a lecture on Wireless Apparatus for Aircraft; Wapiti Steel Wing Construction; the Wapiti in Service; and Aircraft Production Methods.

After these there will be a lecture on the Schneider Trophy Contest 1929 by Flt. Lt. H. R. D. Waghorn, A.F.C.; then a lecture about Racing Seaplanes; next a talk on the Gipsy Aero Engine; probably a lecture on Aircraft Armament; a talk on High Altitude Equipment for Aircraft; and, finally, a lecture on Aircraft Accessories.—Which is rather more interesting than is the Syllabus of the R.Ae.S. itself.

One says "finally," but that is because one has quoted the calendar up to its end. There is no doubt that the sequence of lectures will be continued.

The Society also manages to run Instructional Classes for Prospective Ground Engineers. If the number of letters received by THE AEROPLANE be any measure of the demand, many other firms would do well to emulate it.

These instructional classes include a series of 12 lectures one a week, in which the various rules and regulations

affecting ground engineers are explained, followed by lectures of technical instruction.

One notes that Mr. V. S. Gaunt, the indefatigable Secretary of the Society, finds time not only to run the Society but also to address 25 per cent. of the instructional classes.

THICK WINGS AND SLOTS.

For years the advocates of slots and the advocates of thick wings have been arguing as to whether slots are of any advantage when fitted to thick-wing monoplanes. Mr. Antony Fokker has demonstrated over and over again that he personally can do anything on one of his thick wing monoplanes, either large or small, that can be done with slots. And undoubtedly thick-wing monoplanes of the Fokker type can be made to do extraordinary things in the way of remaining under lateral control when stalled by clever pilots. On the other hand, the advocates of slots claim that whatever a thick wing monoplane can do without slots, it can do still more with slots.

That interesting little broad-sheet, the Handley Page Monthly Bulletin, in its December issue, devotes two pages to illustrations of wind-tunnel experiments with a thick-wing monoplane without slots and with slots.

According to the Bulletin, these experiments are a conclusive demonstration that a thick-wing monoplane cannot be made stable and controllable at or beyond the stall either by special balancing of the controls or by grading of the wing sections, whereas with slots the machine refuses to spin under any conditions.

Those who are interested in this argument should certainly get a copy of the Handley Page Bulletin from Handley Page Ltd., Cricklewood, London, N.W.2.

The price of the Bulletin is 3d., but one feels sure that Mr. Handley Page, with his well-known generosity, whether in dealing with patents or pamphlets, will be glad to send the Bulletin gratis and post free to convince anybody who is really worth convincing.

That category includes all aeronautical enthusiasts from the aerodynamic experts at the Air Ministry down to those who are only starting their aeronautical work as makers of models,—as in fact Mr. Handley Page himself did in his pioneering days,—all the way through the various grades of Service pilots, private owners, aircraftmen in the R.A.F., ground engineers, and all the rest. There is endless fun to be got at Christmas out of the arguments provided in this pamphlet.

THE FIRST AERONAUTICAL FUNCTION OF 1930.

The Royal Aero Club in conjunction with the Royal Aeronautical Society, The Air League and the Society of British Aircraft Constructors will hold a Banquet at the Savoy Hotel, on Wednesday, Feb. 5, 1930.

Group Captain H.R.H. The Duke of York has honoured the combined associations by consenting to be present. The Chair will be taken by Sq. Ldr. the Rt. Hon. Sir Philip Sassoon, Bart., M.P., the Chairman of the R.Ae.C.

Presentations will be made to the Schneider Team and Certficates of Performance in connection with World's Speed Records will be presented to the Supermarine Aviation Works Ltd., Rolls-Royce Ltd., the Gloster Aircraft Co. Ltd., and D. Napier and Sons Ltd., and also to the pilots, —Sq. Ldr. Orlebar, Flt. Lt. Atcherley, Flt. Lt. Waghorn, Flt. Lt. D'Arcy Greig, and Flt. Lt. Stainforth.

The Gold Medal of the Royal Aero Club will be presented to Captain C. D. Barnard and an illuminated Address to the Duchess of Bedford in recognition of their flight from England to India and back.

Application for Tickets, £1 1s. each, from the Members of the above Societies, should be made to the Secretary, Royal Aero Club, 3, Clifford Street, London, W.1. Members may be accompanied by Ladies.

THE PRINCE OF SPORTSMEN.

Our old friend, *The Illustrated London News*, which represents the best public interests, as is shown by the way in which it deals with such diverse subjects as archæology and aeronautics, has produced in its current issue a very fine double-page colour-print of His Royal Highness the Prince of Wales flying over Windsor Castle in his Moth. The picture is one of the best that Mr. G. H. Davis has ever done, which is saying a good deal, for he has done a number of the finest flying pictures that have been produced.

Artist proofs on art paper of this picture, suitable for framing, are also being produced by *The Illustrated London News*. These will certainly be much appreciated as decorations in R.A.F. Messes, in Flying Clubs, and in the homes of aeronautical enthusiasts. The price is about 10s. each from Inveresk House, Strand, W.C.2.

Incidentally the De Havilland Company are to be congratulated on having in this picture as fine a free advertisement as any British manufacturing firm has had for a very long time.

A PROGRESSIVE COMMERCIAL OUTLOOK.

The Times reports that the council of the London Chamber of Commerce recently approved of a memorandum drawn up by its East African and Civil Aviation Sections, which is to be submitted to the British Government. This emphasises the importance of conducting a comprehensive aerial survey of the East African territories under British rule to determine their mineral and other resources and their best lines of development.

The memorandum adds that an aerial survey of East Africa might be conveniently linked up with a survey of other parts of the African Continent under British control, about which information for development is needed.

Members of the East African Section of the Chamber "feel that a more comprehensive programme than is envisaged in the East African proposal is worthy of consideration on the ground of its ultimate economic advantage to the various Colonies and Protectorates participating."

[This resolution seems rather to be what the divines call "a work of supererogation," seeing that the Aircraft Operating Co. Ltd. is already hard at work in the Rhodesian-Congo area, and that various aircraft firms are working in East Africa to develop aeronautical progress.—ED.]

THE GLOSTER SURVEY BIPLANE.

The first example of the Gloster A.S.31 or Survey biplane which has been designed and built by the Gloster Aircraft Co. Ltd. to the specification and order of the Aircraft Operating Co. has been submitted to Type Test at the Aeroplane and Armament Experimental Establishment at Martlesham Heath and has emerged from the ordeal much to the satisfaction of all concerned with it.

Below is shown the performance of the machine as determined by Martlesham Heath tests.

These figures are for a loaded weight of 8,500 lbs. (3.864 kgs.), which includes 460 lbs. (209 kgs.) of survey load, 240 gallons of petrol and 31 gallons of oil.

PERFORMANCE.—Speed, maximum, 139 m.h.p. (222.4 km.p.h.). Speed at 5,000 ft. (1,525 m.) 138.5 m.p.h. (221.6 km.p.h.). Speed at 10,000 ft. (3,050 m.) 135 m.p.h. (216 km.p.h.). Speed at 15,000 ft. (4,575 m.) 128.5 m.p.h. (205.6 km.p.h.). Speed at 19,000 ft. (5,795 m.) 120 m.p.h. (192 km.p.h.).

Initial rate of climb 1,840 ft./min. (567 m./min.). Climb to 5,000 ft. 3.2 min., Climb to 10,000 ft. 7.4 min., Climb to 15,000 ft. 14.2 min., Climb to 19,000 ft. 22.7 min.

Service ceiling 21,900 ft. (6,680 m.). Absolute ceiling 23,200 ft. (7,076 m.). Ceiling with one engine 10,000 ft. (3,050 m.).

Stalling speed 44 m.p.h. (70.4 km.p.h.). Maximum permissible flying weight 9,000 lbs. (4,091 kgs.).

These figures are all superior to the estimated figures published by the Gloster Company at the last Aero Show when the Survey biplane was exhibited to the public for the first time.

A SPECIALISED TYPE.—The Gloster Survey biplane (two Bristol Jupiter engines) specially designed and built for the Aircraft Operating Co. for air-survey work.

Marking a New Era of Progress in Wheel Construction!

THE

DUNLOP

PATENT

AEROPLANE DISC WHEEL

THE many advantages of the Dunlop Disc Wheel have made an instant appeal to Aeroplane manufacturers. Its introduction marks a very definite advancement in the design and construction of landing wheels for aircraft. Dunlop Aeroplane Disc Wheels are stronger and lighter than any other type; provide an excellent streamline contour; are easily adaptable to all forms of brake equipment within the contour of the wheel.

The combination of Dunlop Aeroplane tyres and this new disc wheel makes the perfect unit.

COMMERCIAL AERONAUTICS.

THE INTERNATIONAL COMMISSION FOR AIR NAVIGATION.

The International Commission for Air Navigation insti-ted by the International Air Convention of Oct. 13, 1919, d organised in July, 1922, held its Seventeenth Session in ris on Dec. 10, 1929.

This special Session, with a limited agenda, was held for e purpose of settling without delay the question of the tes to be allotted on the Commission to the British ominions and the problem of facilities of passage to be anted to aircraft used by the League of Nations.

Twenty-five of the twenty-six States parties to the Con-ntion were represented.

M. Alejandre Alvarez, Delegate of Chile, was elected hairman of the Session.

The composition of the Commission was as follows:—*Australia*: Mr. T. Trumble, C.M.G., C.B.E. (Official Secretary of the ommonwealth of Australia in Great Britain). *Belgium*: Major-eneral Van Crombrugge. *Bulgaria*: M. S. Kiroff. *Canada*: The onourable P. Roy (Minister of Canada in Paris). *Chile*: Sr. Alejandre varez. *Denmark*: M. Gregersen. *France*: M. Pierre-Etienne Flandin nd M. Chaumie.

Great Britain and Northern Ireland: Air Vice-Marshal Sir W. Sefton rancker, K.C.B., A.F.C. (Director of Civil Aviation). *Greece*: Admiral otassis. *India*: Sir Atul Chatterjee, K.C.I.E. (High Commissioner of ndia) and Mr. E. J. Turner, C.B.E. *Irish Free State*: Count G. 'Kelly de Gallah (Minister of Ireland in Paris); *Italy*: H.E. General . Piccio and H.E. Cav. de Gr. Croce Giannini. *Japan*: M. Kawai nd General Kaba. *New Zealand*: Major R. M. Wilkes, M.C., and Mr. V. G. Housden.

Netherlands: M. E. Th. de Veer. *Poland*: M. W. Czapski. *Portugal*: rof. Lobo d'Avila Lima. *Roumania*: General Dumitrescu. *Saar 'erritory*: M. Chanzy. *Siam*: Khun Visutra Virajjades. *Sweden*: . W. Winther. *Czechoslovakia*: M. V. Roubik. *Union of South frica*: Mr. C. te Water (High Commissioner of the Union of South frica) and Mr. D. Steyn. *Uruguay*: Sr. Carlos A. Pons. *Yugo-Slavia*: ol. Preditch.

The Secretariat of the League of Nations was represented y M. Robert Haas, General Secretary of the Advisory and Technical Comittee for Communications and Transit.

After having heard the representatives of the British Dominions and India set forth their reasons for desiring a modification of the present provisions of the Convention, which stipulate, as regards votes on the Commission, that "Great Britain, the British Dominions and India shall count as one State," the Commission adopted a Protocol concerning amendments to Articles 34 and 40 of the Convention.

This Protocol was then and thereupon signed by the Representatives of the eleven following States: Australia, Chile, Denmark, France, Great Britain, India, Irish Free State, Italy, New Zealand, Saar Territory, and the Union of South Africa.

As soon as this Protocol enters into force, following its ratification by the States now parties to the Convention, each of the Dominions and India will be entitled to a separate vote in the deliberations of the Commission.

With regard to aircraft destined to ensure communications of importance for the working of the League of Nations, the Commission, invited by the League of Nations to give an opinion on the measures to be taken to facilitate such communications at all times and in particular at times of emergency, considered that the most practical procedure would consist of inserting in the Air Convention of Oct. 13, 1919, a text relating to the facilities of flight to be granted to these aircraft.

This text was accordingly prepared and will be presented to the League of Nations to be examined by the Committee on Arbitration and Security of the League of Nations in conformity with the Resolution adopted by the Assembly in September, 1929.

A certain number of new items, relating to night flights, registration of aircraft, aerial sabotage, international radio-electric service for aeronautics, revision of the customs provisions of the Convention, etc., were taken up to be studied and dealt with at the Eighteenth Session of the Commission which will take place at Antwerp in June, 1930.

GERMANY'S PLANS FOR THE FUTURE.

(Extracted from *Les Ailes*.)

Since its creation, Luft Hansa has essentially devoted itself to the development of an internal network of German air lines. Strengthened by subsidies from the Reich, from various States and from the Towns, it has been able to furnish Germany with a fabric of air lines particularly closely woven.

The reductions of the Budget of this year have caused a radical modification of the policy followed by this Company (Luft Hansa) up to the present time. Willy nilly it has been obliged to practise a policy of economy which has resulted partly in the reduction of personnel and partly in the suppression of a number of routes. The principle of "rationalisation" has triumphed in Aviation as in other fields.

One has criticised the creation by Luft Hansa of innumerable *Hüpflinien* (feeder lines). It is thus that one names the short routes between important provincial centres and the main trunk-lines. These lines are now only maintained in so far as justified by local subsidies and the possibility of using existing *matériel*. The others have been pitilessly scrapped.

The new policy of Luft Hansa is occupied with the development of important trans-European and inter-Continental air routes. It sees in the operating of these lines the principal reason for its survival in the future.

The new European lines which Luft Hansa counts on exploiting next year are the route between Berlin and Constantinople which will be extended to Baghdad; the route between Berlin and Seville by way of Marseille; and that between Berlin and Lisbon.

These lines will be operated by fast night-flying machines, which will fly non-stop or with only one halt. They will be operated on the model of the Berlin-London and Berlin-Stockholm lines. They will carry passengers but above all, mails. The Post Office (of Germany) is very interested.

The first trial has been made over the Berlin-Constantinople route. *Les Ailes* has reported it. The machine was forced to land by lack of oil 50 km. (32 miles) short of Constantinople, at the village of Silibri. The lesson to be learned from this flight is that a commercial machine can fly in 12 hours non-stop the 1,900 km. (1,200 miles) between Berlin and Constantinople.

Two other long distance flights have been made, these over the Berlin-Seville route. Herr von Schroeder piloting the new postal Arado has flown from Berlin to Seville in 13 hours with a single stop at Marseille. On the return journey his time was 14 hours. The distance between the two cities is 2,500 km. (1,550 miles).

The three lines which Luft Hansa is going to develop

A GERMAN MAIL-CARRIER.—The Arado V.1. (525 h.p. Hornet—built by the Bayerische Motoren Werke of Muenchen under license to the Pratt and Whitney Co.). A new type which is being tried-out on trans-European air-mail lines (as described above) instead of slower multi-engined passenger machines.

Digitized by Google

next year: Berlin-Moscow, which has been in existence for several years; Berlin-Constantinople; and Berlin-Seville; must only be considered as the feelers for the future inter-Continental system. Then if the political situation will allow, that is to say if the Russo-Chinese embroglio, and the internal affairs of China are put right, Luft Hánsa counts on prolonging the Russian route to Pekin by way of Siberia with a branch to Japan. Germany possesses in fact three big commercial interests in the Far East and the creation of direct aerial communication can only accelerate their development.

The link between Berlin, Constantinople and Baghdad with a link towards the Indies, by favour of the Turkish and British Governments, seems to us the nearest realisation.

Nevertheless the development that most concerns us is that which is directly in competition with our own Aviation, that is the link between Seville and South America, and Portugal and South America. After the declarations of Herr M. Wronsky, Managing Director of Luft Hansa, one assumes that this line will present, from the postal point of view, the highest return. Our neighbours are concentrating on this aspect of the problem.

The Luft Hansa has already marked three stakes in the South American route. First registering the air route between Berlin and Seville by the Rhone valley and Marseille. Secondly its very active participation in the formation of a network of Spanish air lines which will assure to it a very solid base in the Iberian Peninsula. Thirdly its penetration into South America through the intermediation of the mixed (Nationalities) Condor Company in which the German capital of Luft Hansa preponderates. The company is actually opening the line which joins Rio Janeiro with the Rio Grande.

One cannot help admiring the logical and organised way in which the Germans are proceeding. They advance step by step, but the road they have made they do not abandon. Besides all this they have created an interior system (of air lines) which has made a valuable proving ground for material, personnel and organisation. To-day they are reproducing on a larger scale the lesson of their early experiments. To-morrow they will pass to the attempt of greater things when they will have correct *matériel* and every chance of success.

[And meantime all British effort will lie dormant because anyone who proposes to start an air line will be told by capitalists that Imperial Airways Ltd. have proved that air lines cannot be run without a subsidy. And anyone who asks the Government for a subsidy will be told that all money available for subsidies is pledged to Imperial Airways Ltd.—But Mr. Churchill's dictum that "Civil Aviation must fly by itself" is still the only economic truth.—C. G. G.]

N.F.S. NOTES.

National Flying Services Ltd. now provide at the London Air Park at Hanworth, lock-up sheds for privately-owned aircraft and assure regular inspection and maintenance services. Workshop overhauls and repairs are done under competent craftsmen. And the firm offers an attractive scheme of insurance. The firm's licensed ground engineers inspect and certify the machines as fit for use. And the machines are regularly cleaned and refuelled.

The lock-up sheds cost £3 15s. a month and the maintenance service, under what is known as Schedule B, costs £1 a week. The owner-pilot who does a great deal of flying and needs a more comprehensive service, which leaves nothing to his own personal attention, is offered a scheme known as Schedule A, at £3 a week.

The organisation at Hanworth is now, like All Gaul, divided into three parts: (A) instructional and club flying; (B) taxi and commercial flying, and (C) sales and service. Each division has its own sheds and staff, under the general management of the Senior Pilot.

Mr. Dudley Page, late R.A.F., has been appointed to take charge of Division C. Twenty lock-ups have been, or are being, built for C. Division (which seems appropriate), and a large shed is provided for other private machines and as a show-room for new and second-hand machines. N.F.S. Ltd. now have some twenty-four second-hand machines for sale.

N.F.S. Ltd. have a new insurance scheme by which any flying member of an N.F.S. club who has done twenty hours, including at least ten hours' solo, can insure his own aeroplane up to £300, and take in all third-party risks up to £1,000 for an annual premium of £50.

CROYDON NOTES.

Commercial Air Traffic Companies are given to understand that their aircraft are but faintly welcome at R.A.F. Aerodromes.

In an emergency, they may land on these so Holy spots and even disembark wholly undistinguished passengers without titles or social standing, but unless they obtain special permission, they must not depart from R.A.F. Aerodromes next day for the Continent with passengers, freight or His Majesty's Mails.

What they have to do apparently, is to sneak away to Croydon empty next morning, to the sound of muffled drums and with reversed R.A.F. aircraft in all four corners of the Aerodrome.

Our Air Force must be kept pure and socially uncontaminated of course, but it is hard to see why a commercial machine having once landed, as it were, in a higher social plane than it belongs to, should not be got rid of as quickly as possible next day, with a load of passengers, freight and mails to the Continent, especially as it may be unable to fly empty to Croydon for days and days on account of fog.

It can hardly be expected to fly empty to the Continent from the R.A.F. Aerodrome on such occasions, and the longer it stays in the brilliant social atmosphere of the R.A.F. Aerodrome, the more chance there is of it teaching low manners and horrid swear words to R.A.F. machines. Surely, the R.A.F. would do better to get rid of the social climber as soon as possible at all costs, and then have the Aerodrome purified by issuing peppermints to all ranks and having a full dress, deep breathing parade.

Actually the commercial firms find it worrying when Argosies, Fokkers and so on, come back from such brilliant social surroundings, because the machines are always swollen headed and out of hand. The main trouble is that the machines *will* try to sound the wholly unaccustomed aspirate, which always leads to engine trouble.

We are told that passengers must not be embarked from R.A.F. stations, except in an emergency. Our point of view is that when our aircraft are at R.A.F. Aerodromes and cannot get to Croydon, but can fly straight to their Continental destinations, it is very much an emergency and an important one too. Nobody in their senses supposes we want to fly from R.A.F. Aerodromes if we can

'oid it, surely? And therefore, we again assert, that it is irely an emergency when we want to do so.

Doubtless in the past, some jolly, jolly privateer has set il in the teeth of a hurricane for the sheer fun of the ing, what time the Merchant Skipper sat snug in port. ıe privateer who had no responsibilities and nothing to se but his own ship and his own life, could indulge in sail-g matches with Davy Jones if it so pleased him, whereas ıe Merchant Skipper, who was a no less stout or inexperi-ıced seaman, had to consider his responsibilities for pas-ngers, freight and vessel entrusted to his care by the wners. Moreover, he was expected to show common sense ıd eschew spectacular stuff and his job was to bring his ıyage to a successful conclusion.

History repeated itself the other day when two light single-ıgined aeroplanes crossed the Channel to France on a day gales when the Commercial Services were all suspended. was a splendid and a sporting effort, but it was definitely stunt of stunts, comparable perhaps to that of a gent who ent over the Niagara Falls in a barrel some years ago for ɔ discoverable reason, and lived to tell the tale.

Such feats of flying have a fine filibustering flavour and ır the amateur pilot they are doubtless most thrilling iventures. Lest however, anyone at any time should have reamed of the simulacrum of a howling newsboy in a owling gale, howling, "Fids! Fids! I gloat! Hear me!" ver such a matter, it is best that the view point of the ommercial Air Traffic Companies and the Commercial pilots ıould be made known.

On the day in question, Commercial Services were not ıncelled because it was impossible to fly through such 'eather, but because it was dangerous and inexpedient to o so *from a commercial point of view.*

The pilots who saw fit to cancel on that occasion were men ·ith years of experience of bad weather flying across the 'hannel, and some of them had flown over the World as 'ell. One of them, as it happens, had just come back from is third return flight on the Amsterdam—Batavia air-mail oute, where really bad weather is encountered and is flown hrough in the ordinary course of the job.

Such bad weather, about which no proclamations are ever ssued, is unavoidable, whereas the recent gales, which inci-lentally stopped all cross-Channel boats, can be and should ɔe avoided by air traffic companies and their experienced air-line pilots.

The Air Line Pilot is the Merchant Skipper of the air and ıas very serious responsibilities, which the private owner knows nothing of. The private owner can go on privateering expeditions when and how he chooses, but the Commercial ɔilot cannot.

Comparisons, if any were made, which one does not assert to be the case, between amateur flying for fun and profes-sional air line piloting, are obviously odious and moreover they are inclined to have the ungentle habits of the boomerang as well.—SPRY.

A DESOUTTER DEMONSTRATION.

On Dec. 11 Flt. Lt. A. J. Styran, pilot, and Mr. W. D. T. Gairdner, passenger, took a Desoutter Coupé monoplane be-longing to National Flying Services Ltd. to Manchester and Liverpool, returning next day to London. On the outward journey there was a 50 m.p.h. gale blowing with low clouds and rain-storms, and next day the weather was not much better.

The machine was sent to demonstrate the Desoutter mono-plane to prospective customers in the North of England and it certainly did its job All who flew in it were immensely impressed by its steadiness in a bumpy wind and by the comfort of flying in a cabin through heavy rain. On the homeward journey an air speed of about 95 m.p.h. was kept up.

A FINE RECORD FOR SWITZERLAND.

The Geneva correspondent of *The Times* states that the aggregate distance covered by Swiss air services during the past eight years was 3,906.250 miles, and the number of passengers carried was 62.000. During the same time the machines of Swiss air companies covered 1,562,000 miles without accident and without a single mail-bag being lost.

MODEL AEROPLANES.

Lately one had the pleasure of seeing the model aeroplane factory of Mr. F. J. Mee, of 137a, Greenwich Road, S.E.10. Between 60 and 70 hands are employed here in the mass-production of various types of model aeroplanes, hundreds of which are sent abroad and to the colonies. There are models from 1s. 6d. upwards all easily put to-gether and able to take off under their own power, and to fly from 200 to 800 yards.

Kits of parts are also available from which actually to build the machines. In all these machines, which are amazingly light (some barely weighing 1 oz.), the construction is extremely strong.

A feature of all these machines is the patent bracket which car-ries the bearing of the airscrew together with the airscrew and

Digitized by Google

undercarriage. The object of this is to take the force of impact, should the machine hit anything while it is in the air. The whole bracket is hinged and moves backwards.

It was too dark to see a demonstration flight, but the hundreds of letters which one saw (from officers of the Royal Air Force and also from various Aircraft Constructors) left no doubt in the mind as to the capabilities of these aeroplanes.

Quite apart from these models, however, there is another side. Mr. Mee had made to special order various types of experimental models for the Aircraft Industry, and certain Laboratories.

One also saw the machine which holds the World's speed record for model aeroplanes (34 m.p.h.). The construction was extremely interesting, as it is made from pieces of solid wood carved out by hand. The motive power was five separate rubber motors, geared to one airscrew.

One would suggest that any one of these models would make a suitable gift for a child of *any* age.—C. L. S.

SUPERCHARGED SHAVING.

The ingenious Mr. M. L. Bramson has broken out in a new place. Or rather an old place has broken out again, for this latest invention of his has been incubating for several years. Not content with his Stall Indicator, and with step-fathering the Monospar Wing and the Redrup Engine, Mr. Bramson invented a couple of years ago a wonderful supercharged shaving brush in which the shaving soap is carried in the handle and is fed under pressure from the base of the bristles instead of being untidily distributed on top of them or smeared clammily on the face.

The new brush is marketed by Dunhill's of 30, Duke Street, W.1, which assures the finest workmanship, and the price is 37s. 6d., which assures the wealthiest clientele. Possibly for that reason it has been made as fool-proof as possible in its action.

As a matter of fact, it is really very good value for the money, because you cannot buy a first-class badger-hair shaving brush of such size for less than a guinea anyhow, and the convenience of being able to do away with messy soap-sticks and squdgey paste tubes, besides actual economy in the use of the soap, is worth the extra money.

Anyhow, it is an ideal Christmas present, because the essence of a present is that it should be something in the nature of an extravagance to which one would not lightly treat oneself.

AN OMISSION.

On the cover of THE AEROPLANE of Nov. 13 a photograph appeared of one of the original Sopwith Tabloids over the title "A Vision of the Past." The photograph had been in this office for many years and there was nothing on it to indicate its origin. It seemed peculiarly suitable to give a hazy idea of days gone by, so it was used.

Since then evidence has been produced which proves that the photograph was taken by the Chief Photographer of our esteemed contemporary *Flight*, to whom due acknowledgment is now made as the owner of the copyright.

NEW COMPANIES.

V. G. ENGINEERING LTD.—Private company. Registered Dec. Capital, £100 in 1s. shares. Objects: To carry on the business of aeronautical, mechanical, electrical, automobile, nautical, civil structural and consulting engineers, inventors and designers, etc. The subscribers (each with one share) are: W. Villa Gilbert, 19, Hillcrest Road, Acton Hill, W.3, consulting engineer. G. R. Waygood, Abbey House, Westminster, S.W.1, accountant.

W. Villa Gilbert is the first permanent director. Secretary: C. E. George. Registered office: 202, Abbey House, Westminster, S.W.

PERSONAL NOTICES.

FORTHCOMING MARRIAGES.

GORE—CHAMBERS.—The engagement is announced, and the marriage will take place early in January, between Flg. Off. Charles William Gore, R.A.F., son of Lieut.-Col. C. W. Gore and Mrs. Gore, of 30, Marlborough Road, Donnybrook, Dublin, and Frances Catherine, eldest daughter of Major O. A. Chambers and Mrs. Chambers, of Manor House, Sandgate, Kent.

HERN—DAVIES.—The engagement is announced between Horace E. Hern, D.F.C., youngest son of the late J. H. Hern, and of Mrs. Hern, Hillersdon Avenue, Barnes, and Mary P. Davies, L.D.S., R.C.S.Eng., only daughter of Mr. and Mrs. P. Percival Davies, Havant, Hants.

PELLY—SPENCER.—A marriage has been arranged, and will shortly take place, between Claude Bernard Raymond Pelly, R.A.F., eldest son of the Rev. D. R. Pelly, D.S.O., and Mrs. Pelly, of Woolbeding Rectory, Midhurst, and Margaret Ogilvie Spencer, daughter of Mr. and the late Mrs. E. J. Spencer, of 3, Grand Avenue, Hove.

WALKER—DANIELS.—The engagement is announced between Flt. Lt. Henry Walker, M.C., D.F.C., R.A.F., only son of the late Dr. Muirhead Walker and Mrs. J. J. Roberts, of Buenos Aires, and Eleanor Louise, only daughter of Mr. and Mrs. Clark E. Daniels, of Madison, Wisconsin, U.S.A.

MARRIAGES.

HUMPHERY—PATERSON.—On Dec. 14, at Sunninghill, G. Woods Humphery to Dorothy Josephine, daughter of Col. Philip J. Paterson, C.M.G., D.S.O., and Mrs. Paterson, of Sunningdale, Berks.

TRAVERS—SHERWILL.—On Dec. 7, at Harrow-on-the-Hill, Charles Tindal Travers, youngest son of the late James Lindsay Travers to Marian, daughter of the late T. H. Sherwill.

YEATMAN—WRIGHT.—On Dec. 9, at Holy Trinity, Brompton, Harry Morgan Yeatman, son of the late Mr. and Mrs. H. O. Yeatman to Sylvia Margaret Giraud Wright, daughter of Mr. and Mrs. R. E. Giraud Wright.

BIRTH.

KNOWLES-BROWN.—On Dec. 7, at Hampstead, to Marjorie (nee Cordingley), wife of A. W. Knowles-Brown (late R.A.F.)—a son.

Bolts, Nuts, Set Screws, Etc., by KIRBY BANKS SCREW CO. LTD., LEEDS.

In mild, high-tensile nickel, nickel-chrome or stainless steel to any standard.

ESTABLISHED 1864.

Mass Production and Precision in every detail.

PATENTS.

STANLEY, POPPLEWELL AND FRANCIS, Chartered Patent Agents, Jessel Chambers, 88, Chancery Lane, W.C.2. Telephone, Holborn 6393; Telegrams, "Notions, London."

Aircraft Designer of over 20 years' experience desires to interest parties in foreign Patents covering new and practical variable camber wings, wind tunnelled and favourably reported upon; also in new form of flying-boat. Both devices exceedingly cheap to produce. St. Anthony, The Cloisters, Rickmansworth, Herts. Telephone, Rickmansworth 540.

Patents and Designs Acts, 1907 to 1928.—Notice is hereby given that Strachimir Kermektchiew of No. 14, Lietzenburgerstrasse, Berlin, W.15, Germany, seeks leave to amend the Specification of the Application for Letters Patent No. 288272 and in respect of an invention entitled "Process and apparatus for suppressing the resistance on bodies stationary or to be propelled in fluids of any kind and for obtaining at the same time a propulsion of said bodies." Particulars of the proposed amendment were set forth in the Illustrated Official Journal (Patents), of Nov. 20, 1929. Any person or persons, may give Notice of Opposition to the amendment by leaving Patents Form No. 19 at the Patent Office, 25 Southampton Buildings, London, W.C.2, within one calendar month from the date of the said Journal. W. S. Jarratt, Comptroller-General.

PRACTICAL FLYING.

CINQUE PORTS flying club (Subsidised). WINTER RATES commence Oct. 1. 6 months' sub. 31s. 6d. Entrance fee 21s. Monthly sub. 21s. No entrance fee. Seven of our members took "A" licences in 4 weeks ending Sept. 26. Under 2 hours by car from London. Enlarged Club Room and Bar. Send 6d. to Hon. Sec., Hythe, Kent, for illustrated brochure. "LEARN AT LYMPNE."

CHEAPEST FLYING IN THE WORLD! at the Norfolk and Norwich Aero Club. Subscription £3 3s. Instruction rates 25s. per hour. Accommodation can be arranged on Aerodrome. Applications to Secretary, Mousehold Aerodrome, Norwich.

Learn to Fly at the Midland Aero Club. Four tuition machines, two fully qualified expert instructors. No waiting. Particulars Hon. Secretary, 22, Villa Road, Handsworth, Birmingham.

National Flying Services Ltd. (Tel. Ger. 9316). Join N.F.S. Learn to fly. Fly when you wish.

Southern Aero Club.—Thorough Avro Tuition, no waiting list. "B" licences instruction arranged. Apply Secretary, Shoreham Aerodrome, Sussex.

The De Havilland School of Flying, Stag Lane Aerodrome, Edgware, Middlesex. Fourteen machines: Nine Moths, five advanced training machines. Seven Pilot Instructors, Lecture Classes, Restaurant and Recreation Pavilion. The largest and most up-to-date civilian organisation for flying tuition in the British Empire.

Phillips and Powis School of Flying.—An "A" licence in the shortest time and the lowest cost at Reading. Personal attention, no waiting, concentrated instruction. Gipsy Moths. The School is very successful in turning out good pilots in a minimum of time. Special offer, trial lesson 12s. 6d. Reading Aerodrome. Sonning 114.

SITUATION VACANT.

Good Fitter required by Aircraft Firm in Croydon district, accustomed to plate fittings in steel and duralumin also able to operate lathe, good prospects for suitable man. Box No. 5749, THE AEROPLANE, Cannon House, Pilgrim Street, E.C.4.

MISCELLANEOUS.

Aircraft Development and Equipment Ltd., 112, Windmill Road, Brentford, Middlesex. Confidential Investigations Technical Assistance. Designs. Large stocks of engines—Condor, Eagle, Beardmore, Mono Hispano Instruments of all descriptions. (Principal actively experienced in Aviation from 1904.)

Petrolmotor Castings, partly machined, ½ horse (9s. 9d. per set.) Catalogue 3d. Madison's Works, Wade Street, Littleover, Derby.

Repairs.

The Brooklands School of Flying Ltd., having established new workshops, is in a position to carry out repairs and overhauls for C. of A. in the shortest possible time at competitive prices.—Phone, Byfleet 436 and 437.

ON THE DEPARTING CHIEF.

On December 31, Marshal of the Royal Air Force, Sir Hugh Trenchard, Bart., G.C.B., D.S.O., vacates his post as Chief of the Air Staff which he has held since 1919. He will be succeeded on January 1 by Air Chief Marshal Sir John Salmond, K.C.B., D.S.O. This therefore seems a fitting and proper time at which to publish some record of the services of the officer who has been responsible not only for building up the Royal Air Force, but for maintaining its integrity in the face of strenuous opposition from politicians and from the Senior Services.

Also apart from his strictly official service record there seems good reason at this time to publish some few reminiscences of his work with the Royal Flying Corps, and with the Royal Air Force after that third service was formed by amalgamating the Royal Naval Air Service with the Royal Flying Corps, so that those who have served under him of late, but were too young for the War 1914-18, may know something more of the officer to whom their Service owes its existence.

A Service Career.

Hugh Montague Trenchard was born in 1873, the son of Capt. Montague Trenchard, King's Own Yorkshire Light Infantry.

He was gazetted to the Royal Scots Fusiliers from the Militia in September, 1893, and was promoted Lieutenant in August, 1896.

In 1899 he went to the war in South Africa. While on active service he was promoted to Captain, and later he was dangerously wounded. His services in South Africa were somewhat varied. At first he commanded the Bushman's Corps of the Imperial Yeomanry. Thereafter he commanded Canadian Scouts. He was concerned in the operations in the Western Transvaal from July to November, 1900. Thereafter he took part in the Mounted Infantry operations in the Transvaal and in the Orange River Colony up to the end of the war. In 1902, at the end of that war, he was promoted Major by brevet.

In 1904 he went to West Africa, and served in Southern Nigeria until 1906. From 1908 till he was invalided home from West Africa, he was Commandant of the North Nigerian Regiment of the West African Frontier Force.

During this period he was in command in the Owerro district, and patrolled the unsettled portion of the Ibiti and Kwa country. He also commanded the Bandi-Onitaba Hinterland expedition.

For his services in West Africa he was made a Companion of the Distinguished Service Order in 1906. And while in West Africa he held the temporary rank of Lieutenant-Colonel.

"CEASELESSLY EATING THE DISTANCES THAT WAS THE WONT OF THEM."—(Kipling—*Song of the Desert.*)

THE WEST AFRICAN FLIGHT.—The three Fairey III.F high-speed bombers of No. 45 (Bomber) Squadron, R.A.F., which flew, under the command of Sq. Ldr. F. J. Vincent, D.F.C., from Helwan to Tamale and back between Oct. 19 and Nov. 29, making twenty-two stops according to plan. The Flight was photographed from another Service machine over Cairo.—(*R.A.F. Official photograph.*)

Digitized by Google

In November 1910 he returned to duty with the Second Battalion of the Royal Scots Fusiliers,—reverting thus to his substantive rank as Captain.

Aeronautical History.

In August 1912 he learned to fly at the Bristol School at Brooklands. And his Royal Aero Club Certificate is No. 270.

In October 1912 he was appointed Instructor at the Central Flying School at Upavon on Salisbury Plain, with the rank of Major in the Army. This School had shortly before been organised as a joint establishment at the cost of the Admiralty and the War Office. At it pilots were trained for the Naval Wing and the Military Wing of the Royal Flying Corps, in those days before the Royal Naval Air Service had come into being as a separate branch of the Royal Navy.

Being a joint establishment the first Commandant of the Central Flying School was Captain Godfrey Paine, R.N. Major Trenchard was appointed Assistant Commandant to him in September 1913.

On the outbreak of War on August 4, 1914, every available officer and man of the Royal Flying Corps, either flew or was transported to France under Major-General Henderson. Major Trenchard was left with practically a row of empty sheds and a few officers and men who were unfit for foreign service, and a few decrepit aeroplanes which were also unfit for service. And with these he was set the task of building up not only a new Flying Corps but reserves big enough to keep our Flying Forces adequately supplied during the rest of the War.

For this task he was appointed from Assistant Commandant at the Central Flying School to be Officer Commanding, and in Charge of Records of the Royal Flying Corps, at South Farnborough, with the temporary rank of Lieutenant Colonel while so employed, as from August 10, 1914.

Having set this house in order as far as was humanly possible in three months, Colonel Trenchard was summoned to France in November 1914 to take command of No. 1 Wing R.F.C. at St. Omer, which was then the Headquarters of the Royal Flying Corps in France.

In August 1915 General Sir David Henderson returned to England from France to take charge of the whole Department of Military Aeronautics in this country, and Colonel Trenchard was appointed to command the R.F.C. on active service with the temporary rank of Brigadier General.

From August 1915 until December 1917 the history of General Trenchard's service in France is the history of the Royal Flying Corps. When he took over the command of the Royal Flying Corps it amounted in importance in the scheme of the Army in France to a Brigade.

In March 1916 he was appointed temporary Major-General and thus the R.F.C. itself was promoted to the importance of a Division. General Trenchard himself was promoted substantive Major General on January 1, 1917. And in that rank he served until the Royal Air Force came into being on April 1, 1918.

The Royal Air Force.

At the beginning of January, 1918, while the Royal Air Force was in process of formation and before it came actually into being, General Trenchard was recalled from France and was appointed a Member of the Air Council with temporary rank in the Royal Air Force as Major-General. At the same time he was appointed the first Chief of the Air Staff.

At that time Lord Rothermere was our first Secretary for State for Air. His ideas and those of General Trenchard concerning what was the right and proper way in which to conduct one of His Majesty's fighting services did not agree. The result was that very soon after the Royal Air Force came officially into being, in April 1918 General Trenchard resigned, and Major-General Sykes was appointed Chief of the Air Staff.

The resignation of General Trenchard caused such a storm, not only in Service circles but even among the politicians, that within a few days Lord Rothermere also handed in his resignation.

The Independent Force, R.A.F.

Lord Rothermere was happily succeeded by Sir William Weir, later to become Lord Weir of Eastwood. Before becoming Secretary of State for Air, Sir William Weir had been in charge of the production of all aeronautical material for the Naval Air Service and for the Royal Flying Corps, and later for the Royal Air Force. In this office as later in the office of Secretary of State for Air, Sir William Weir had shown remarkable ability in judging men and getting their best work out of them. Having this faculty, he saw at once the folly of allowing a man of General Trenchard's qualities to remain unemployed.

General Trenchard was asked to take up again the office of Chief of the Air Staff, but he refused to take the place of General Sykes, who had served with him in the earliest days of the R.F.C. Then he was offered the command of the Royal Air Force in France, which had been given to Major-General John Salmond when General Trenchard came back from France. General Trenchard very properly refused to oust from an important command an officer in whom he himself had the highest confidence. Quite apart from this, General Trenchard was not the kind of man to accept an appointment which would deprive another officer of great opportunities and high position.

After a period of consultation with Sir William Weir General Trenchard agreed to take command of a new force formed partly of existing squadrons of the Royal Air Force, to be augmented as soon as possible with new squadrons, which force was to be stationed in the East of France, as near as possible to the German frontier.

REBUILDING THE AIR FORCE.—Sir Hugh Trenchard inspecting the Aircraft Apprentices at Cranwell. On the right of the picture is Air Commodore (as he was then) F. C. Halahan, who is himself shortly retiring from the R.A.F. as an Air Vice-Marshal.

with the express purposes of bombing the German centres in which munitions of war were manufactured, and of bombing the railways by which these munitions, and troops also, were sent to the German front in France. It was the first force in the World to make air war independently of troops on the ground, and so was the prototype of the Air Force as it now is.

For this purpose General Trenchard was appointed to Headquarters R.A.F. in France for special duty in May 1918. And in June 1918 he was appointed definitely to command what was known officially as Independent Force R.A.F. The intervening month was spent in arranging with Sir John Salmond to take over certain squadrons, and in the general organisation of the Independent Force.

Sir Hugh Trenchard commanded the Independent Force until the end of the War, or rather until the Armistice was declared on November 11, 1918, and he remained with it until the middle of December 1918 when he returned to England to take over once more the post of Chief of the Air Staff, which post he has held from that date until his appointment lapses on December 31.

Sir Hugh Trenchard's services during the War 1914-18 have been, or are being, duly set forth in the Official History, called "The War in the Air." And they have been told more intimately by the Hon. Maurice Baring (Hon. Group Captain, Reserve of Air Force Officers) in "R.F.C. H.Q." The history of his war at home for the preservation of the R.A.F. has yet to be written by another historian.

Strenuous as were Sir Hugh Trenchard's duties in France, and difficult as was his position during the conflict with Lord Rothermere in April 1918, the greatest of his work still remained to be done. He had before him ten years of hard labour in which he had first of all to watch the destruction, for purely financial reasons by the political people, of what was at the date of the Armistice the greatest aerial fighting force the World has ever seen, and from its ruins he had to build up a Third Service for the King, under or against strenuous opposition from the Navy and the Army, but mostly from the Navy.

AWARDS AND DECORATIONS.

This is another chapter in his Service history, and before starting on it, we may well have before us a list of his various decorations and distinctions. They are part of his official history and they are taken from official records.

As already mentioned he was appointed a Companion of the Distinguished Service Order in September 1906 for services in Southern Nigeria. In January 1914 he was appointed a Companion of the Order of the Bath, obviously for his work in forming the Royal Flying Corps in its early days and for his work as Assistant-Commandant at the Central Flying School.

At this time he already held the Queen's South African Medal with three clasps, the King's South African Medal with two clasps, and the West African Medal with a clasp for 1904, and two other clasps, one for 1904-5 and another for 1905-6.

His first decoration in the War of 1914-18 was the award of the Russian Order of St. Andrew, first class, with sword for gallantry and distinguished service in the field. Th was awarded in August 1915.

In February 1917 he was awarded the Cross of Commander of the French Legion of Honour for distinguished services rendered during the course of the campaign. An in September 1917 he was awarded the Belgian Order of Leopold, grade of Commander, for distinguished service during the campaign.

In *The London Gazette* of January 1, 1918, he was gazetted a Knight Commander of the Bath, for valuable services rendered in connection with military operations in the field.

In March 1918 he was awarded the Belgian Croix de Guerre for distinguished service. In November 1918 he was awarded the Order of the Crown of Italy, grade of Commander, for valuable services. In July 1919 he was awarded the American Distinguished Service Medal for valuable services in connection with the War. Also, on some date which was not gazetted, he was awarded the Russian Order of St. Stanislas of the first class with swords.

In July 1919 he was appointed Colonel of the Royal Scots Fusiliers,—the appointment is dated in the Army List to July 13, 1916.

In *The London Gazette* of December 30, 1919, Sir Hugh Trenchard was created a Baronet, which title he holds at the moment of writing.

In January 1921 he was awarded the Japanese Order of the Sacred Treasure in recognition of valuable services rendered in connection with the War. This was a slightly belated recognition on the part of our oriental Allies, but of course it had a long way to come.

In *The London Gazette* of January 1, 1924, Sir Hugh Trenchard was promoted Knight Grand Cross of the Order of the Bath.

Over and above these decorations and distinctions, Sir Hugh Trenchard was appointed extra Aide-de-Camp to the King, and to be Brevet Colonel, in the *London Gazette* of June 3, 1915. And on Feb. 22, 1921, he was appointed Principal Air Aide-de-Camp to the King.

THE WAR AFTER THE WAR.

Any attempt to record the work of Sir Hugh Trenchard in building up the Royal Air Force during the past ten years would need at least several large volumes. Therefore in such a memoir as this one cannot hope to give more than the barest outline of the work which he has done. Moreover, readers must remember that there is no official history and there are no official records published of that work.

At various times official documents have been issued recording changes in the organisation or in the status of the Royal Air Force, but even to quote those records would fill a whole book. Therefore one believes that perhaps a general account of the process by which the Royal Air Force has reached its present position may be better than a list of definite dates.

When the Armistice was signed the Royal Air Force

consisted roughly of thirty thousand officers and three hundred thousand men. It had more aeroplanes and better aeroplanes than any air force in the World, and it had complete command of the air.

For a few months the Air Force remained on a War footing. At any rate it retained its war numbers, though, as in every other Fighting Service which had been engaged in the War, it suffered from a nervous reaction which had disastrous effects on discipline and on its general bearing.

As soon as might be after the Armistice, the political people, for perfectly good economic reasons, set about disbanding the Fighting Services. And the Royal Air Force was disbanded along with the rest.

Everything was in a state of chaos. The best men in the Air Force were wanted urgently to re-establish the industries of the Nation, and so were many of the best officers. Consequently the Air Force lost nearly all its best mechanics, and a number of its best officers were given opportunities of well-paid work in civil life. Also, for some curious psychological reason, many of the best fighting men and many of the officers who were the best leaders of men, had no liking for a service career and managed to get themselves demobilized just at the very time when their character, or even their popularity, would have made them most useful in holding together the old spirit of the Air Force.

On the other hand, quite a number of officers who could very well have been spared from any of the King's Services, not seeing any prospects for themselves in civil life, managed to persuade their immediate commanding officers to recommend them for permanent commissions in the Air Force. The net result was that the Air Force kept a good many officers who, if not actually undesirable, were of no particular use to the Service and let go, or sent out, many officers who would have been of the highest value.

While all this was going on, Air Stations were being closed down, buildings which had cost many millions of pounds were abandoned. All orders for new aircraft and new engines, and even experimental orders for the development of new types of aircraft, were cancelled. All progress ceased and chaos fell upon the Air Force.

THE WAY OUT OF CHAOS.

From this chaos Sir Hugh Trenchard was called upon to build an Air Force which would be capable of protecting not only the British Isles but the whole British Empire against the next biggest air force in the world, or presumably against a combination of the next two biggest air forces. The Parliamentary people grudged him money, and though he kept many of his most trusted officers, new officers and men grudged themselves to the new Air Force.

Added to this he was faced with the difficulty that the Admiralty, which had treated the Naval Air Service during the War with contempt, and had even prevented by order the Naval Air Squadrons from doing the work which they should have done, by harassing the enemy in France and in the Mediterranean, and by adequate patrolling of our coasts for the protection of our food ships, suddenly awoke to the fact that in any future war an Air Force of some kind would be necessary to the life of the Fleet. The immediate result was that the Admiralty started a powerful agitation in the Press and by political string-pulling to break up the Royal Air Force into its original components, so that the sea-going side of the Air Force might be returned to the Navy.

To a lesser degree so far as public agitation went, but none the less quite strongly in a quiet way, with a great deal of political influence brought to bear, the War Office also sought to have the Royal Flying Corps returned to it.

If these two powerful influences had prevailed there would be to-day no Royal Air Force. We should doubtless have a Royal Naval Air Service which would be well equipped,—for the Admiralty can always find money from the tax-payer for whatever schemes it may fancy. And we should probably have a highly efficient but very small Army Flying Corps,—for the War Office is never the favourite of the Nation as is the Admiralty, and the Army has to make do with what it can get after the Navy has helped itself. But the one thing certain is that we should have no Air Force as such.

Our Naval aircraft would be subject, in type and in use, entirely to the ideas of Naval Officers and to the requirements of the Fleet as such, and our Army Flying Corps would be used entirely for Army purposes such as scouting for enemy troops on the ground, and for artillery observation, and for tactical bombing within the radius of action of the armies in the field. But the great work of an air force as such could not possibly be developed.

Sir Hugh Trenchard had to fight these powerful influences practically singlehanded. At any rate he was at once the brains and the spearhead of the defence of the Air Force. At all times he had the wholehearted support of the various Secretaries of State for Air and their Under Secretaries. They always supported him in the Cabinet.

But his real fight was not with the political people. It was ultimately with the Committee of Imperial Defence, on whose advice the Cabinet would necessarily act in a purely Service matter of this sort. Time after time the Sea Lords, backed by the whole weight of the Admiralty, tried to wreck the Royal Air Force, and time after time Sir Hugh Trenchard managed to save the Royal Air Force as a Third Service, one and indivisible.

His task was all the more difficult because to make good his own case he was obliged at all costs to supply the Navy and the Army with such aircraft as they might need, so that they could have no excuse for saying that the Air Force was starving the sister services.

The result was that in certain years vast sums of money were spent on new equipment for the Fleet Air Arm, which was not in any way being used on active service, while the squadrons of the Royal Air Force, which were very much on active service in 'Iraq and in Southern Arabia and Central Africa and on the North-West Frontier of India were carrying on their work on antiquated war machines which had in fact been designed as far back as 1916 and 1917.

Even to-day in India and in 'Iraq there are squadrons of the R.A.F. using D.H.9A's with American-built Liberty engines, and other squadrons are using Bristol Fighters with Rolls-Royce engines, which were designed in 1916, and these Squadrons are doing work under most difficult and dangerous conditions which is of direct use and even of the utmost necessity for the safety of the Empire.

In the meantime, aeroplanes of completely new types are produced year after year for the benefit of the Fleet Air Arm, which so far has not been called upon to use them on anything resembling active service, other than a little admonitory flying round Shanghai Harbour.

Whatever arguments the Navy may produce now or hereafter for handing over the complete control of the Fleet Air Arm to the Admiralty, they can never say that the Air Ministry in any way kept the Navy short of aircraft of the very latest possible type.

Admittedly there is plenty of room for improvement in the types of aircraft used by the Navy for the Fleet Air Arm. But that is the fault of the Admiralty rather than of the Air Ministry. The Navy insists on aircraft being produced for certain work which the Navy imagines to be necessary and the Air Ministry produces them, but there would be little enough difficulty in improving on a great many of the types on which the Navy insists, by altering entirely the way in which they are used.

To a much less degree the Army has also been the cause of the Air Force keeping the obsolete types of aeroplanes. Ever mindful of the needs of the Army, the Air Ministry has re-equipped Army Co-operation squadrons with aeroplanes and engines of new types. And it has spent quite fair sums of money in reconditioning and altering Army Co-operation machines so as to make them as effective and as safe as possible.

The last squadrons of all to be re-equipped with modern machines have been the bombing and fighting squadrons and the long-range night-bombing squadrons of the Royal Air Force, which are intended to conduct Air War without direct co-operation with the other Services.

So much then for the general policy which the Air Council and the Air Staff have had to follow. Let us then look at some of the other points of policy which have been so wisely followed in the past ten years.

LAYING THE FOUNDATIONS.

One of the chief criticisms hurled against Sir Hugh Trenchard during the earlier years after the War, more especially by political critics in the House of Commons, was that he allowed such vast sums to be spent on bricks and mortar, while the officers and men of the Royal Air Force were compelled,—unwillingly, according to the critics,—to fly the old types of aircraft to which one has referred. Apparently these critics would have had most of the money which was available for the Air Force during the years immediately following the War, spent almost solely upon the pay of large numbers of officers and men and on the production of new aeroplanes for all squadrons.

What they seem to have forgotten was that aeroplanes are no good without pilots to fly them and that pilots cannot fly unless their aeroplanes are kept in perfect order, and that aeroplanes cannot be kept in order without properly trained mechanics, and that mechanics cannot be trained or do their work without proper workshops and without proper lodging.

As has already been said, the best of the mechanics left the Air Force immediately after the Armistice, or as soon after as they could get themselves demobilized. And the garage-hands and such, who enlisted from the street when out of work, were more trouble to train than if they had known nothing at the start.

Also a quantity of the best pilots left the Air Force. And as the years went on other pilots grew too old to fly or developed a dislike of flying. Moreover to maintain a

fighting Air Service at its best a constant supply of young and energetic pilots is necessary.

When the War ended the Air Force was living in War-time huts of wood or iron. There were no proper barracks, there were no proper quarters for officers, either married or unmarried. In fact about the only decent housing of the Air Force was that provided for the aeroplane itself. There were plenty of enormous and solidly-built sheds for them, but there were hardly any decent quarters anywhere for the human elements.

Consequently Sir Hugh Trenchard set out on one quite definite policy.

First of all he established a first-class training establishment for Aircraft Apprentices. Then he built enormous and beautifully equipped barracks for the boys, and quarters for their instructors, and excellent work-shops, in which they could learn their trade. Elsewhere, comfortable barracks were provided for the airmen. And, years afterwards be it said, attention was given to the quarters of Officers who had hitherto been living in wartime huts with leaky roofs and walls which were by no means weatherproof. In fact even to-day, eleven years after the Armistice, one doubts whether the majority of the Officers' Quarters in the Air Force, with their leaky roofs and windows, and non-shutting doors, and damp floors, would be considered fit for habitation by Officers of the Navy or Army, or by any Urban Council's sanitary inspectors.

But the great thing was to build first of all a solid foundation on which could rest an Air Force which will be capable of expansion when the next War comes. And to that task Sir Hugh Trenchard has devoted these ten years.

Having established Training Establishments for Mechanics, he then proceeded to lay out great Flying Training Schools. Here Officer Pilots and a certain number of N.C.O. Pilots were to be trained,—and have been trained. And be it said nowhere in the world is the training of Pilots and Mechanics as good as it is in our Air Force.

THE SUPPLY OF OFFICERS.

The next step was the foundation of a Cadet College in which young men could be trained from their school age to become Permanent Officers in the Royal Air Force. This establishment was organised at the former Royal Naval Air Service training establishment at Cranwell in Lincolnshire. At this College the human element was more important than bricks and mortar. Consequently the gentleman cadets and the instructional staff have been been living in war-time huts from the foundation of the College until now. And the other ranks have been living in fairly good barracks which were built by the Naval Air Service. Only during the present year was the foundation stone of the new College laid.

Notwithstanding these drawbacks, or perhaps rather because of them, the Cadet College at Cranwell has turned out from its very first term, officers of the class most desirable in the time when the King must fight his foes.

At first there was difficulty in getting boys from our best Public Schools to join the Air Force. To-day the best people are beginning to see that the Air Force is to be taken seriously and may be justly reckoned on on a social level of the Senior Services.

Also the class of boy who is most desirable at Cranwell is now attracted thereto by a system under which Officers of the R.A.F. who have distinguished themselves more or less, and have themselves come from our great public schools, are unofficially appointed Liaison Officers with their old schools and are encouraged to go there and talk to the people who have succeeded them, with the idea of inducing the best of them to join the R.A.F., and come to Cranwell.

How successful this association is may be judged from the fact that, a year or so ago, at one examination for Cranwell six candidates appeared from Wellington College. And to-day Winchester, Eton, Harrow and Rugby and our other major public schools send their fair share of Cadets to what is now called the R.A.F. College.

Furthermore, a Staff College has been established at Andover, where officers are trained in the higher arts of their profession.

THE SHORT SERVICE SYSTEM.

Another system in the R.A.F. for which Sir Hugh Trenchard has been criticised is that which is known as the Short Service Commission System. Under this a young man joins the Royal Air Force as a Commissioned Officer, just after leaving school, or somewhere up to the age of twenty-two or twenty-three, and is engaged for a period of five years, which may in some instances be extended to seven years.

At the end of his engagement he leaves the Air Force with a gratuity which is quite big enough to keep him comfortably while he is finding a job on which to live. Also there is in the R.A.F. a system known as the Vocational Training System under which an officer holding a Short Service commission can study for one or other of the well-paid professions. There also exists an Employment Board, which has in fact been very successful in planting officers into well-paid jobs when their term in the Air Force has expired.

In spite of this, successive Air Ministers, and Sir Hugh Trenchard in particular, have been accused of luring young men into the Air Force at a tender age and throwing them out into a cold and unsympathetic world just when they would be earning a good living if they had gone straight from school to a University or into some profession.

This is very unfair criticism, because, in point of fact, of those officers who have left the Air Force during the past few years, the great majority have found employment at pay which is as a rule higher than they would have been getting if they had gone in for medicine or law or engineering at the same age. And few of them would have been earning as much money as they are getting if they had gone in for commerce in the ordinary way.

As a matter of fact there are to-day a number of important firms who prefer to take a man out of the Air Force after he has done his five years' service and pay him fairly well for a year or two while he is learning their par-

ticular business. They find that after having that three years under discipline and in presumably decent society, coupled with an opportunity of seeing foreign countries, the young officer is much more a man of the world and much better able to take on a responsible job than if he had gone straight into an office from school.

That, however, is merely an explanation of why the short service system is a benefit to young men and not a disadvantage. The real reason for the existence of the Short Service System is that it is a necessity for the protection of the British Empire.

The first and most important thing is that, being our First Line of Defence, as it is officially, the Air Force must have an adequate reserve of properly trained pilots. And the only way to build up such a reserve is to keep on training young men.

The amount of money voted by Parliament for the Air Force is so small that the Establishment is now only 3,000 officers and 30,000 men. Of those 3,000 only a certain number are or can be competent to fly. If every officer were given a permanent commission, as some people argue is most desirable, we should find ourselves at the end of a certain number of years with all our Flying Officers at the age of forty or thereabouts, all our Flight-Lieutenants ranging from 45 to 55, and all our Squadron Leaders somewhere about the age of 60. And we should have absolutely no reserve of young pilots at all.

Consequently, the only possible thing to do is to train young men to fly and then let them go from the Air Force while they are still young enough to get well-paid employment in private life. By constantly passing a few hundred young men out of the Air Force while they still have ten or fifteen years of flying in front of them, we shall be able to maintain a constant reserve of some thousands of pilots who with a little refreshing on the outbreak of War will still be able to do good war flying.

Apart from this reserve of pilots who have passed through the Regular Squadrons of the Air Force, a number of Auxiliary Squadrons have been established during the past five years. These correspond quite closely to the Territorial Battalions of the Army. There are also a certain number of Reserve Squadrons of the Air Force which correspond to the Militia Battalions of the Army. These also form a useful and well-trained reserve both of officers and men.

Thus, as may be seen, the past ten years have been spent in laying down a foundation for an Air Force which on the outbreak of War can be expanded within a few weeks to a fighting force of considerable power, and can be further expanded within a few months to what will be probably the biggest air force in the world.

Sir Hugh Trenchard has said in one of his rare speeches that the Air Force has laid down the foundations of a castle and that if nobody wants to build on it anything more than a cottage it will be at any rate a very sound cottage. And those who regard the safety of the British Empire as being of some importance will be duly grateful to him for having laid the foundations on which we can finally build an Air Force worthy of the Empire.

TECHNICAL DEVELOPMENT.

Somewhat earlier in this article the statement was made that for a period a large proportion of the money which was voted for the Air Force was expended on bricks and mortar in which to house first of all the Airmen and then the Officers of the R.A.F. But all the time this expenditure was going on, and while there was no money with which to re-equip the squadrons of the Air Force with modern aircraft, a comprehensive scheme of technical development was being followed.

One important member of the Air Council is an officer who carries the title of The Air Member for Supply and Research. The duty of this officer is to direct, organise, and control scientific research and the practical development of new types of engines and aircraft.

This Department is divided into two Directorates: the Directorate of Scientific Research and the Directorate of Technical Development. The one department studies the purely scientific side of aeronautical progress and the other develops aircraft and engines and equipment which are already in existence.

Under this system new machines of advanced types for use in War are constantly being built, and then tested under the hardest possible conditions. When a machine of considerable promise is introduced, a number of the same type are built. Thus while the Regular Squadrons of the Air Force are still doing their regular work on machines which were perhaps designed during the War 1914-18, we have at any rate plans for new machines constantly going through the Research and Development Directorates, in such a way that they can be put into mass production at short notice should War break out. In this way the Air Force is assured of best and most up-to-date aircraft in the World, and all their equipment,—and in the cheapest possible way.

REBUILDING THE AIR FORCE.—Sir Hugh Trenchard with the Premier, Mr. Ramsay MacDonald, at the R.A.F. Display at Hendon.

AIRSHIPS.

Yet another policy on which the Administration of the past ten years has been severely criticised is that relating to airships. At the time of the Armistice we had a number of big airships which were all more or less copies of Zeppelins. These were allowed to rot in their sheds till they became unusable. We built a few more slightly modern ships during the year or two after the Armistice, and one of them was the first airship to cross the Atlantic. After that we dropped making airships altogether. And the critics said that we were allowing other nations to get ahead of us in this important method of air transport.

The fact of the matter was that money which might have been spent on airships was wanted for bricks and mortar. An airship costs anything between half a million and a million pounds, according to its size, when all its overhead charges are reckoned and when only one ship is built from bed-rock, as it were. And a lot of bricks could be bought for that much money.

Then when the barracks which were immediately needed had been built and when some of our squadrons had been re-equipped with comparatively modern aeroplanes, the Air Ministry proceeded to build some more airships and the Administration was again criticised. This time the complaint was of waste of money on what must obviously prove to be a useless type of air vehicle. In point of fact, the abandonment of the original airship programme, the institution of the six-ship programme and its later curtailment to the two airships which now exist, have all been thoroughly justified.

THE POSITION TO-DAY.

Let us then take a look at the Air Force as it is to-day, when Sir Hugh Trenchard is leaving his post. We have not the biggest Air Force in the World. The French *Armée de l'Air* is bigger, probably the Italian *Regia Aeronautica* is bigger, and the Russian Government claims that its Air Force is bigger still, but our Air Force does more flying per machine and more flying per pilot than any Air Force in the World, and it does that flying with a very much smaller percentage of accidents, for miles flown and for pilots flying, than does any other Air Force in the World.

This year, 1929, in fact the casualties are only about half those of last year and much more flying has been done.

So far as the quality of the Air Force is concerned, all that any anxious taxpayer need do is to go to the Royal Air Force Display at Hendon each year. There he will see

flying of a quality which cannot be seen anywhere else in the World. Other nations may have individual pilots as brilliant as ours, other nations may have pilots who have put up records which ours have not yet touched, but no other nation can show such amazing organisation on the ground, or such a high standard of combined flying as is shown by the R.A.F. And, let the fact be remembered that ground organisation and combination in the air is the essence of strength in time of war.

Representatives of every foreign Government in the World come regularly to the Air Force Display at Hendon so that they may see for themselves what represents the high-water mark of Service flying for the rest of the World.

Even in America where men of our own blood fly as much and as well as our own people do, they admit that even their best combinations of pilots have never put up a show equal to that put up by a formation of the Royal Canadian Air Force which appeared at the American National Air Races this year, and that Canadian formation, be it remembered, learned its flying from the Royal Air Force, and was in fact led by an officer in the Royal Air Force who had been lent to the Canadian Government.

Apart from that, although so many of our squadrons are still using War-time aeroplanes, the fact remains that there are no aeroplanes in any Air Force in the World so well built or so well maintained as are ours. Our detail design, our material, and our construction are ahead of those of any other Nation. And our air mechanics, or aircraftmen as we call them in these days, in the Air Force, are far and away superior to those of any other nation.

Undoubtedly, there is still plenty of room for improvement in the design of our aeroplanes and in their equipment. But as Service aircraft go, we have nothing to learn from other nations. Our weakness is on the commercial side and not on the Service side, and this itself is the strongest possible evidence of the soundness of the policy which has been followed by the Administration at the Air Ministry for the past ten years.

Whatever charges of lack of commercial enterprise may be made against our Aircraft Industry for being content to depend on the Air Ministry not only for its orders but for its actual specifications to which it builds aircraft, instead of going out for the ordinary commercial trade of the world, we have the satisfaction that our First Line of Defence—the Royal Air Force—has the finest possible equipment.

Thanks entirely to the encouragement of the Air Ministry we have captured the World's Records for speed, also we have produced a long range aeroplane which, though it did not actually beat the World's Record for distance at the first attempt, came very near doing so in spite of conditions which would have prevented any other aeroplane from coming as near beating the Record as our people did.

Also we have produced flying-boats of several types which have proved themselves superior to those built by any other Nation.

The excellence of the personnel and material of the Air Force, as it has been rebuilt during these ten years, is shown by the way in which the Air Force never fails to carry out any job which may be given to it.

We have had that great flight to the Far East and round Australia and back by way of China by four standard Service flying-boats. We have had the annual flight from Cairo to the Cape and back, and from Cairo to West Africa and back, year after year. We have had our continual little troubles with tribes in Arabia. We have had small wars on the North-West frontier of India. We have had more recently that excellent example of organisation, the despatch of aircraft from Baghdad to Peshawur and the rescue of the unfortunate foreigners who were in peril in the Capital of the King of Afghanistan.

Quite in the early days after the War the Air Force organised the desert Air Mail between Baghdad and Cairo and prepared the way for our Imperial air route to Australia.

Of all the Air Forces in the World, ours was the first to have handed over to it the complete control of a country which needed to be controlled. To Sir John Salmond, the new Chief of the Air Staff, was committed the control of 'Iraq by the Air Force. Through his good work we were able to remove many battalions of troops from that country, and to save the British tax-payer and the Indian tax-payer many millions of money per annum.

Later on, thanks to the success of the Air Force in 'Iraq, the control of Palestine and Trans-Jordan was handed over to the Air Force. And more recently Aden was made an Air Force command instead of an Army command.

In each of these instances millions of pounds have been saved and peace has been maintained with the least possible loss of life as well as the least expense.

In every way we have reason to be proud of our Air Force. And for every reason we are entitled to have confidence in it. And the man whom we owe this happy state of affairs is without argument, Sir Hugh Trenchard.

THE MAN AND THE TIME.

He himself would be the first to say that if he ha done the job somebody else would have done it. P that is true. There is much in the old proverb th are as good fish in the sea as ever came out of it.— times there are better. But there is also as much old saying that the time finds the man. And certain anxious time during the last ten years in which body had to decide whether we were going to ha Air Force as our first line of defence or whether we going to have two aerial branches of the senior fo services, each of which would be merely an auxili those services, has found the man to do what is ne for the good of the Empire.

Earlier in this article one said that with the promo Sir Hugh Trenchard step by step in the Army the R Flying Corps itself was promoted from Brigade to Di and from Division to Corps. In much the same way the tion of the Royal Air Force in the affairs of the N has been marked by the promotion of Sir Hugh Trenchar

In 1919 the rank titles in the Air Force which before had been the same as those in the Army were altere a complete new series of ranks was invented. When th new ranks came into being Sir Hugh Trenchard w appointed an Air Marshal, a rank which correspond that of Lieutenant-General in the Army. Thus the Force was at that time regarded as being of abou same importance as an Army Corps. In April 192 was promoted to the rank of Air Chief Marshal, which cor sponds with that of a General in the Army, or to a Admiral in the Navy,—thus the Royal Air Force itself recognised as having the status of an Army, under the mand of a General.

In the New Year's Honours List of 1927, Sir Hugh Tr chard was promoted to the highest rank possible in Air Force, that of Marshal of the Royal Air Force. T rank corresponds with that of a Field Marshall in the Ar or of Admiral of the Fleet in the Navy. An officer of rank may command several fleets at sea, or several arm on the ground, or several air forces in the air.

At the same time Sir John Salmond was promoted rank of Air Marshal and since then he also has been p moted to the rank of Air Chief Marshal. Thus the Force now finds itself in a position of still having at its he an officer carrying the substantive rank of a full Gen in the Army. And Sir Hugh Trenchard retires from Air Force with the rank equivalent to that of Field Mars

To have risen from being an Infantry Major in 1914 the equivalent of Field Marshall in 1927 is a truly remar able history. There cannot have been, in the British Arm anyhow, any officer who has risen so rapidly as he ha and we may be thankful that although he is leaving th post of Chief of the Air Staff, Sir Hugh Trenchard sti has many years of usefulness before him.

CERTAIN MEMORIES.

So much, then, for official records and historical facts But this piece would not be complete without some fe memories of the earlier days, which are still in the mind of the older people in, and out of, the R.A.F.

Writing a memoir of a man who is alive is always dif cult. It is difficult enough when he has definitely retired from active life and has become a back number. It is sti more difficult when he is a man with a great future still before him,—and we must remember that, as the histories of great soldiers show, Sir Hugh Trenchard is a young man.

There have been brilliant young leaders, but they have de pended for much of their success on experienced soldiers. Napoleon's victories owed much to the staff-work and organisation of old Royalist officers. And Alexander must have inherited, besides the Macedonian phalanx, an able Chief of Staff from his father, Philip.

In the war 1914-18 two of the most successful generals were nearer 70 years of age than 60. General von Mackensen, whose record of victory on the Eastern Front was unbroken, celebrated his 80th birthday a week or two ago. And General (now Field Marshall) Plumer was a middle-aged man in the South African War 30 years ago, yet he of all British generals, had the finest record in France, and in Italy, for victorious attack and successful defence.

At the end of the War 1914-18 the fact was commonly known that arrangements had been made for General Trenchard to take supreme command of all the Air Forces of the Allies in 1919,—if the War had gone on. He was to have been "the Foch of the Air,"—to use the graphic French phrase. He is now 56 years of age. So by any ordinary reckoning he may still be the Generalissimo of the Air Forces of the League of Nations against Oriental barbarism any time within the next twenty years.

And if he should not be needed for the defence of Western Civilisation he has still before him many years of usefulness as the guardian of the Royal Air Force against any

attempts to break it up between the two older Services. That such attempts may be made is more than likely. The remarks of Admiral Beamish in the House of Commons a few weeks ago may only have been the personal opinions of a sailor of the old school. But there is just as much likelihood of their having been inspired by the younger school at the Admiralty, who now understand the power of air force over the sea, and want it in their own hands.

Though Sir Hugh Trenchard has, happily, been the object of little public interest in the past ten or eleven years, except as the subject, mostly by innuendo, of attacks in certain personally-prejudiced papers, and so is not regarded by the people at large as anything of a political force, there are few men who carry more weight, or whose opinions are more highly regarded, among the people who matter most in this country. And we may be sure that all his strength will be devoted in future to keeping safe the Royal Air Force, one and indivisible.

Those who know all about everything except their own business have been telling us for months that on retiring from the post of Chief of the Air Staff Sir Hugh Trenchard was to be appointed Governor-General of New Zealand. Unfortunately for their repute as prophets somebody else has just been appointed. Those who know Sir Hugh Trenchard best will be very much surprised if he leaves this country for anything other than a short holiday. He is much more likely to stay here to keep an eye on the welfare of the R.A.F., and confound the politics and frustrate the knavish tricks of its enemies.

Sir Hugh Trenchard's influence in the greater world, as it always has been in the Services, is due simply to his singleness of purpose and strength of personality. There is never any doubt about what he wants or what he means to get,—but his methods are all his own.

None of his achievements in this way have been due to eloquence. He hates making speeches, and there are few worse speechmakers when duty compels him to speak. But, after he has made a speech, his hearers are always enlightened, and often inspired by it. And one has never heard him speak without his uttering some outstanding phrase or some idea which has cast new light on a puzzling problem.

Having been so much concerned with Service Aviation ever since it began in 1912, when the Air Vice-Marshals of to-day were junior captains in the Army or two-stripe lieutenants in the Navy, one has perforce come closely in touch with many who served with Sir Hugh Trenchard. And even in those earliest days all had for him the same mixed feeling of affection and respect which has been the secret of his power throughout his career.

At the Central Flying School, when he was Assistant Commandant, newcomers were at first afraid of him. His size and his abrupt way of speaking over-awed them,—apart from the awe which a young officer feels for a senior with many years of distinguished war service. But his strict sense of justice, and his kindliness, and his sense of humour soon did away with their fear of him, and increased their respect.

And yet there is one fear which those who have served with him never lose. That is the fear of losing his good opinion of them, or of losing his friendship if they have been so fortunate as to win it.

Because of his deep voice and abrupt speech some irreverent junior at the old C.F.S. at some time or another referred to Major Trenchard as "Boom,"—and the nickname stuck. To-day it still survives as a mark of esteem and regard.

A SQUADRON STORY.

His curious influence over men is perhaps best shown by a story of a certain single-seat squadron in France. The squadron had been shot to pieces. Its best pilots were dead or wounded or missing. It had been filled up with youngsters fresh from home, and they had lost their nerve before really knowing what war was, and they had taken to coming home with imaginary engine failures, or damaging their machines in forced-landings-on-purpose before crossing the enemy lines.

The squadron commander was heart-broken. The wing commander came and talked to the squadron. So did the brigade commander, but without much effect. And at last they appealed to the G.O.C., General Trenchard.

Word was passed round that he was coming, and the squadron shivered in its boots. He came and inspected the squadron,—each pilot standing by his machine in its shed. He had a few words with each pilot, and asked him how he liked his machine and so on, but never a word of reproof. Then he went to the mess for lunch.

After lunch,—which was an unpleasant meal, because of the dressing-down to come—the G.O.C. got up, and the squadron stood strictly to attention along its tables waiting for its punishment. Boom walked to the door, turned, with the door half open, looked along the rows of faces for a few moments, said quietly, "Well! You're good boys" and went.

Within a week or two that squadron was one of the most effective fighting units over the lines.—The G.O.C. had the material on which he had to work.

AND A DEPOT STORY.

Wherever he went the G.O.C. spread confidence and encouragement. He had a way, when on a visit of inspection, of talking to any stray air-mechanic who crossed his path, asking the man where he came from and what his trade was, and telling him that his job was as much needed to win the war as that of the finest pilot. Sometimes the man gibbered with fear at being talked-to by the G.O.C.—and that distressed General Trenchard more than anything. But they always went away full of keenness and enthusiasm. And so one can tell a story against the G.O.C. himself.

Once he was inspecting the big engine-repair depot at Pont de l'Arche, and was walking round with the O.C. and a captain who commanded a section. As they came to the section office they found half a dozen men standing to attention outside, evidently waiting for the section-commander. So the G.O.C., as was his habit, had a few words with each man, asked him about his job, and told him that we could not win the war without fellows like him—and words to that effect.

As he talked he noticed the captain looking anxiously at the O.C. Depot, and the O.C. looking nervously at the captain. So, as they walked away he turned to the captain and said, "Who *are* those men, S——?"—"I'm sorry, Sir" answered S——, "But they're my morning's defaulters."

After that the party of inspection had to retire round the corner of a shed till the G.O.C. had done laughing.

THE PRODIGAL'S RETURN.

There is another story which deserves to be told. When General Trenchard had his H.Q. at St. Omer he went one day to Calais in a hurry. On the way he overtook a squadron car driven by a young pilot, who, being young and foolish, instead of letting the staff-car pass, stood on his accelerator, by way of being funny, and smothered the G.O.C. with dust the rest of the way to Calais.

When he stopped in the town, the staff car drove alongside, and a righteously infuriated G.O.C. demanded to know his name, rank, and squadron. Thereafter, he was told that not only discipline but manners must be preserved with the Army in France, and that he had better go back to England and never be seen in France again. And sure enough an hour or two after going back to his squadron, he was sent home in disgrace.

After which he was sent to the Eastern Mediterranean where he acquired a D.S.O., and an M.C., and three or four foreign decorations, and a couple of years later he came back to England to defend London. This was during the lamentable Rothermere's period as Air Minister, while Sir Hugh Trenchard was Chief of the Air Staff. And the young officer was called to the Air Ministry then at the Hotel Cecil, or the "Bolo House," to an air-defence conference.

After the conference the C.A.S. went over to him and for the second time asked his name.—When he gave it the C.A.S. asked him what he meant by coming to the conference, and by having that string of medals and decorations, when he had been sent home from France as a bad boy. And since then there has been no more fervent worshipper of the C.A.S. than the perpetrator of the disgrace crime.

A POST-WAR APPOINTEE.

Since the War Sir Hugh Trenchard has handled his men in just this same way of his own. There was, for example, a test-pilot of great skill who was also an engineer of unusual ability. His turn came for service overseas. The experimental unit to which he belonged protested loudly against his being made to do ordinary flying duty, and argued that he was indispensable. So the C.A.S. said in effect,—"No man is indispensable, and in a fighting service no man must be allowed to become indispensable, so that makes his removal necessary. But if he is so clever, send him to the Staff College." And to the Staff College he went.

After a few months there, he admitted to a sympathising friend that technical work is infantile compared with Staff work. And to-day he is on a fair way to high command, instead of being a kind of glorified aircraftman with a dash of the aerobat and the scientist.

Yet another personal story. A certain officer who had been at war in the War 1914-18 from the beginning to the end and for a while afterwards, came home from over-seas and was sent to see the C.A.S., who, after asking him about his last campaign asked what job had been given to him. The war-maker said that he had been made a staff-officer and that he didn't like being a staff-officer, he liked making war, and please couldn't he go to the next war that was beginning.—Said the C.A.S.—"No! You've got to be a staff-officer. We're none of us staff-officers here and we've got

"Bristol"

The "Bristol" method of Steel aircraft construction has been evolved through years of patient research and experimental work, until to-day it represents the most efficient and most durable method of steel construction. Nothing but the finest quality high tensile steel is used in the structural portions o "Bristol" aircraft, and the special design and arrangement of the air frame members make the duties of maintenance and repair at once easily and quickly accomplished. Information upon the general upkeep and execution of field repairs is always available at the "Bristol" Company's works. In this connection special tools have been designed and manufactured which make it quite possible for semi-skilled labour to be used to execute repairs to aircraft, that might well in many cases prove an expensive and prolonged job.

to learn. I'm a bush-whacker by trade, but I have to sit here and do staff-work. So you go and learn to be a staff-officer too."—And he went,—with results which those who know do know.

Presumably, on the strength of having commanded three kinds of irregular cavalry in South Africa, and having done six years in Nigeria in command of Hausas and nigger levies, and having governed negro tribes with success, Sir Hugh Trenchard has a perfect right to describe himself as a bush-whacker if it so pleases him. But no fighting man has ever had a finer appreciation of the value of good staff-work.

Apropos that West African period,—during the later part of the War, when the name of Sir Hugh Trenchard had become famous in Dispatches, one used to get a lot of quiet amusement out of older people who had served in West Africa by asking them whether they remembered anyone by the name of Trenchard.—"Ah! Yes!" they used to say. "Such a pity too. A good fellow, and a fine soldier. They sent him home to die, I believe. Absolutely a wreck. Completely broken by service up-country. No man could go through what he did and live."—And so on.

And there used to be quite a trouble to persuade them that this brilliant general who had built a Flying Corps from nothing, and had won the command of the air, in spite of the seeming impossibility of doing such a thing, was the middle-aged infantry major who had been sent home to die some eight or nine years before.

Sir Hugh Trenchard has a way of coming to life again in disconcerting ways. He came to life with the Independent Force, which ultimately became the prototype of all Independent Air Services, after so many people thought that he had been killed, in the political sense, by Lord Rothermere,—and, as in the poem, "the man recovered from the bite, the dog it was that died."

After the war he was actually on the verge of death for months. But he arose from a sick-bed which looked like being his death-bed, and completely defeated the whole weight of the Admiralty intrigue to cut up the Air Force. He fought them before the Committee of Imperial Defence and into the Cabinet,—and emerged with the R.A.F. and himself stronger than ever.

We all hope fervently that he may never again have to face death so nearly as he has done in the past,—until his time comes to leave us for a better place. No man has deserved better of the Commonwealth, and no man has better earned a peaceful rest till the King and his country need him again. So let us all wish him and Lady Trenchard and his sons many happy New Years, and fresh victories in the future.—C. G. G.

THE S.B.A.C. AND PROPAGANDA.

On Dec. 18 the Council of the Society of British Aircraft Constructors gave a Lunch to the accredited aeronautical representatives of the leading English newspapers to discuss with them the position of the British Aircraft Industry in relation to the World's markets. At the time of this meeting one was under the impression that it was a purely personal affair and was not intended for publication. But as Major C. C. Turner has published a general expression of the S.B.A.C.'s views, one feels that a fuller account of the meeting may be acceptable.

MR. C. R. FAIREY, who presided in the absence of Mr. Handley Page, the Chairman of the S.B.A.C., who was fog-bound on the other side of the Channel, said that the idea of the meeting was to give and get views on the position of British aviation in relation to the immense amount of propaganda circulated all over the World, as well as in this country, in favour of the United States and Germany. Mr. Handley Page had intended to give his views resulting from his recent visit to the United States, but he, Mr. Fairey, would express those views as well as he could from what he had heard from Mr. Handley Page.

The idea had been spread everywhere that aviation in the United States was a vast commercial success and that American aircraft constructors were vastly ahead of us in execution and design. This was all the result of steady purposeful national propaganda the like of which was unknown in Great Britain.

The truth was that there was not an air-line working at a profit in the United States except on lavish postal rates. These postal rates had in fact only been got by a supplemental Post Office Vote of $5,000,000.

Apart from that, Mr. Handley Page had told him that the American aircraft factories had 15,000 aeroplanes in stock.

He himself had recently been in Germany. He had gone there with the impression that German civil aviation was a vast and highly organised business, and that the German technical people were vastly in front of ours. He had quite failed to see anything of the kind.

At Tempelhof Aerodrome, which he had been told was a kind of Clapham Junction of the air, he spent the greater part of a day and only saw three aeroplanes. One was Dutch, one was Czechoslovak and only one was German.

As regards technical development he did not see any evidence that their technique was as good as ours. One firm announced to him that they had not changed their design in ten years and he was shown engines in which the internal design appeared to be older than that.

Workshop methods were employed which would not be tolerated here. They had no Aeronautical Inspection Department. And they had no central technical body. He had been told that German aircraft carried higher payloads than ours, but if they did it was certainly by scraping over tree-tops and by flying without reasonable safety.

As regards the British Aircraft Industry itself, we had been told of the vast and impregnable self-complacency of British aircraft constructors, and that they were blind to opportunities. This doctrine was beginning to grow and to be preached and to be believed. And in spite of it we were told that the British Industry were making vast profits.

We should examine the truth and see for ourselves. If there was any truth at all in this outlook at least we had achieved something. British air lines in any case came as near as any in the World to operating at a profit. British manufacturers turned out a better article at a price which was very little more than that of their competitors. And our export figures were as good as those of any other country. The difference was that German and American aircraft were sent out with vast propaganda. The German system of propaganda was unrivalled. When you went to a German factory you were shown museums of models of all the types that a firm had built, and of parts specially prepared for exhibition. In Berlin at all the cinema houses films were always shown of German aircraft under varying conditions. The whole atmosphere was good.

In America everybody was surrounded by an atmosphere of the greatness of American aviation. Youngsters in America grew up with a belief that American squadrons crossed the lines during the War in quantities, whereas in fact not one American squadron on American aircraft ever crossed the lines at all.

Lindbergh had become a national idol. And yet his flight was not as long as that of Flt. Lt. Carr, R.A.F., to the Persian Gulf a few days earlier.

In this country we were surrounded by a national atmosphere of self-depreciation. He suggested that we should think of ways of pushing aviation. We could do so more honestly than any other country.

In no country was the technique of construction so high as here. British constructors were now approaching the time when we could create markets and could supply aircraft which would pay their way without subsidies. We must realise from winning the Schneider Trophy that our technique was right.

Thereafter followed some very interesting remarks from representatives of the Press. Possibly in view of the position of individual correspondents in relation to the editors of daily papers their names had better not be mentioned but their views certainly deserve to be.

One correspondent, who is notable for the accuracy of his information and for the soundness and moderation of his views, said that we of the Press thanked the S.B.A.C. for letting us hear their point of view. He agreed with all that Mr. Fairey had said.

He had tried to get definite figures for the performance of the Dornier Do.X. and such figures as he had been able to get, which were by no means complete, showed that its loading per horse-power was heavier than that in the best British aircraft and that its wing-loading was higher. The landing-speed of all German aircraft was too high, and we were getting nearer to the ideal.

But, he said, the Aircraft Industry and the Air Ministry themselves were responsible for lack of propaganda. When new machines were produced the Air Ministry would not allow information to be published and the Trade was afraid to release it. And there was no good in our preaching the excellence of British aircraft on a text six months old.

He quoted for example the fuss that had been made in the papers about automatic control (otherwise the Robot pilot), which apparently had been produced in the States. In fact we in this country had been using it for a year, and those who were closely in touch with developments had constantly asked the Air Ministry for permission to publish something about it and had been refused.

Also recently the experiments made at the expense of the Guggenheim Fund in fog flying, which were wholly estimable, had been circulated from American sources and published. And only then did the Air Ministry let out some information that we had been using instruments which made fog flying at least as possible, and that our instruments were in regular production.

Further, he said that even to-day we had never been told the horse-power of the engine which won the Schneider Trophy. The Rolls-Royce "R" engine should have been given credit at the time for the horse-power it developed

Digitized by Google

He suggested to the S.B.A.C. that they should tackle the Air Ministry for greater liberty, and that films of test-flights of new and interesting types of aircraft should be taken and should be circulated to increase public interest. Showing films of the outside of a new machine would not teach anybody anything, in fact even experts might be allowed to inspect every part of most new machines without learning anything. Nobody could tell from looking at a piece of metal what its constituents were.

He said that he was very much inclined to advise the S.B.A.C. to take a more independent line and damn the consequences.

The next speaker, who represents one of our great provincial papers, suggested that the S.B.A.C. might appoint a real live man as the publicity agent for all British aircraft who would tell people who wanted to know what the Trade's activities were. Propaganda were needed to tell the World just as much as the Air Ministry allowed.

The thought of the number of American machines in Canada made him sad. He knew that the Americans were trying to capture all other markets as well and he would like the S.B.A.C. to be more active.

He pointed out that the British Empire in itself offered as as great opportunities for aviation as the United States had within its own borders, and we stood to gain more by air communication. He admitted that our air lines came nearer paying their way than did those of any other nation, but it was in Australia and not in Europe. He believed that the function of Great Britain was to design and produce paying aircraft, and of the Dominions to operate these aircraft. He suggested that the S.B.A.C. might arrange meetings at reasonably frequent intervals to give their views to the Press.

The Editor of THE AEROPLANE said that he felt rather like the criminal in the dock, but that he agreed with every word that Mr. Fairey had said. He knew perfectly well that we could build better aircraft in this country than any other country could build, just as we could make anything else in the World better than any other country. But the point he wanted to impress on the Trade was that we must make what the market wants.

He brought up the old argument that a number of important members of the Aircraft Industry habitually drove American cars, and said that the one thing he wanted to prevent was that history should repeat itself and that people in our Dominions and all over the World should use American aircraft as they use American cars.

He said that, not being a metallurgist, he was under the impression that the Germans knew more about light alloys than we did, especially magnesium alloys, but that otherwise he knew that we were ahead of any other country in design and construction.

But the point was that we were not making the type of machine which the Americans would soon start selling in the British Dominions. The Americans had got the car trade of the World because the cars they developed for their own use suited our Dominions, and the cars we built for our home use did not suit our Dominions, but the air was practically the same all over the world, and the types which were wanted in the Dominions were also the types which could be sold at home.

The representative of one of our most important evening papers said that his trouble was that when he tried to get any information about British aircraft he had great difficulty in finding anybody in any firm who could or would tell him anything that would make a story. Very often they were afraid to say what they knew without referring to higher officials in the firms.

He pressed for a more active propagandist spirit in the Industry itself, and brought forward a number of arguments in favour of greater activity, illustrated by examples of lost or neglected opportunities.

Another speaker said that the Press had been accused of making too much out of air crashes. He pointed out that when a crash did happen there was the greatest difficulty in getting any reliable information which would counteract the effect on the public of such an accident, such as explanations of what did happen.

Mr. Fairey interpolated the remark that the number of crashes in the Air Force this year had been only half that of last year. And the speaker replied that if this fact were made known, and properly given to the Press, this would make excellent propaganda.

Mr. Fairey in replying said that the first speaker had certainly hit on a vital point. The Air Ministry might very well relax the amount of secrecy with which it surrounded new British products. There had been considerable relaxation of late years. One of the first results of the permission to export British war machines which were still in current use, after Sir John Higgins had become Air Member for Supply and Research, was that our exports were doubled or trebled.

He admitted that he himself had driven American cars for a number of years, but that now he knew better and had bought a British car.

Quoting Mr. Handley Page, he said that our complaint was that the British Government insisted on being neutral, whereas the Governments of other nations laid themselves out to push their national products by every possible means.

A FURTHER NOTE.

All this needs very little comment. But one would like to point out a few salient facts. The first is that this meeting must obviously have far-reaching effects, in that the S.B.A.C. now probably understands the point of view of the Press much better than it has done hitherto and no doubt will understand the need for more active propaganda.

On this point one would draw the attention of the S.B.A.C. to the fact that potential buyers all over the World constantly receive masses of American aviation papers, the smallest of which is very much bigger and very much more elaborate, thanks to the amount of advertising support that it receives from the American Aircraft Industry, than are either of the two British aircraft papers which have for many years been spending what little money they have been making in pushing their circulations abroad for the benefit of the British Aircraft Industry,—despite the fact that they lose money on every copy they sell.

The second is that, while we are admittedly far ahead of all other nations with our war-machines and flying-boats and seaplanes and our "giant air-liners," as the Press loves to call them, and while we are still further ahead with our light aeroplanes—which account for the bulk of our increased exports of aircraft—we are not yet making the types for which there is a current market.

Mr. Siddeley has done the wise and courageous thing in frankly taking over the Fokker designs for three-engined jobs,—much as Mr. Fairey imported Curtiss designs six years ago, and, by improving on them, improved our war-machines till they are the best in the World. But we are not yet producing the cabin-job at a moderate price. There is nothing between the Desoutter at £800 and the Avro 10 at £10,000 or so, except some small-size three-engined jobs which cost a good deal of money, while other countries offer 4- to 6-seat cabin machines at £1,500 to £2,500.

One may perhaps illustrate this argument best by pointing out that though Mr. Fairey has now bought an English car, the English car trade has taken ten years to produce one which he has thought worth driving. And we cannot afford to wait ten years to produce the ideal civil aeroplane while the World, including the British Isles, is being flooded with cheap and good-enough machines built in America, and France, and Germany.—C. G. G.

BRITISH AIRCRAFT EXPORTS.

The following figures for exports of aircraft manufactured in the United Kingdom to foreign countries and to the British Dominions and Colonies have been supplied by the Department of Overseas Trade:—

1926.		
Aeroplanes complete	150	£391,471
Engines complete	266	£296,347
Other parts		£430,821
Total		£1,118,639
1927.		
Aeroplanes complete	140	£205,183
Engines complete	380	£396,143
Other parts		£483,629
Total		£1,084,955
1928.		
Aeroplanes complete	358	£450,552
Engines complete	432	£348,606
Other parts		£527,714
Total		£1,326,872

The probability is that the figures for 1929 will be a great deal higher, thanks to the increased export of Moths and Avians, to all countries, and of war machines—chiefly Fairey III.Fs and Westland Wapitis and Bristol Bulldogs to the Dominions, and to some foreign countries. Also the exports of Bristol, Armstrong Siddeley, Cirrus and Gipsy engines have been very large.

AMERICAN AIRCRAFT EXPORTS.

In the first nine months of 1929, 275 complete aircraft, valued at $4,397,311 (£879,460), were exported from the United States, as compared with 162 aircraft valued at $1,759,653 (£351,930) for the whole of 1928.

The 275 aircraft were distributed to 23 foreign countries, of which twelve were Latin-American. Fifty-nine per cent. of all exports of complete aircraft went to Cuba, Central and South America. Mexico and Chile were the biggest customers.

VICKERS (AVIATION) LIMITED, et The SUPERMARINE AVIATION WORKS, Ltd.

Les usines.

L'usine de Weybridge de la société Vickers (Aviation), Ltd., située à 32 kilomètres de Londres à Byfleet, comté de Surrey, est la plus grande fabrique d'avions terrestres que possède le groupe. Le principal atelier de montage a une façade de plus de 120 mètres de long sur la piste automobile de Brooklands; de l'autre côté se trouvent les hangars d'aviation qui embrassent un terrain consacré aux essais en vol. L'usine même consiste en une série de constructions modernes en béton et acier couvrant une superficie d'environ deux hectares et demi. Intérieurement les principaux ateliers présentent les vastes dimensions auxquelles on s'attend lorsqu'il s'agit de la production normale en série d'appareils mesurant 30 mètres d'envergure. C'est ainsi que le principal atelier de montage a 4,275 mètres carrés de superficie, l'atelier d'entoilage 745 mètres carrés, l'atelier d'enduisage 465 mètres carrés et l'atelier des machines 2,790 mètres carrés.

La construction des hydravions se fait aux usines de The Supermarine Aviation Works, Ltd., à Woolston et Hythe, près de Southampton, dans le comté de Hampshire. La rade de Southampton est un des plus beaux ports naturels du monde et convient admirablement pour les essais et les manœuvres d'hydravions. Ces conditions favorables se prêtent au développement des avions du type marin et procurent à ces usines un grand avantage sur celles dont la situation est moins fortunée. Il est certain que Southampton est appelé à devenir l'un de premiers ports aéromaritimes du monde.

La principale usine Supermarine, située à Woolston, couvre une superficie de plus de 13,000 mètres carrés, dont 3,000 mètres carrés sont occupés par les ateliers de montage et 1,300 mètres carrés par l'atelier d'enduisage.

Un peu plus bas dans la baie de Southampton, à Hythe, se trouve une autre usine d'une superficie d'environ 16,000 mètres carrés, comprenant un vaste bâtiment en acier de 7,135 mètres carrés d'étendue. Cet édifice a 152 mètres de long sur 47 mètres de large et 11 mètres de hauteur libre, et peut accommoder à l'aise le plus grand avion qui ait jamais pris l'air jusqu'à ce jour.

Etant donné que les usines d'aviation Vickers et Supermarine travaillent dans la plus étroite coopération, les notes qui suivent se rapportent à leurs ressources combinées.

Elles disposent d'un laboratoire métallurgique complet équipé des derniers appareils d'essais mécaniques des matières premières, et notamment d'une machine Avery de 30 tonnes à levier unique pour essais à la traction, d'une machine Brinell, d'une machine Firth à mesures de dureté dite "hardometer" et d'un scléroscope Shore. Il y a aussi des machines spéciales pour les essais de tôles au pliage et pour l'épreuve de câbles de commande pouvant avoir jusqu'à 10 mètres de longueur. Un certain nombre de matériaux sont également soumis à des essais microscopiques et chimiques.

La résistance des matériaux à la corrosion et les revêtements destinés à les protéger sont l'objet de minutieuses études; d'autre part, des bacs spéciaux sont installés pour le traitement thermique expérimental des métaux et pour le traitement anodique du duralumin.

Il existe aussi des bancs d'étirage pour la production de profilés spéciaux en duralumin et en acier.

Un matériel moderne de peinture au pistolet a pris la place de la peinture à la main, parce que la couche ainsi obtenue est plus légère, plus uniforme et protège mieux contre la corrosion.

Ces usines fabriquent des accessoires d'alimentation en essence qu'elles fournissent à toute l'industrie aéronautique de la Grande-Bretagne.

FAMOUS FLIGHTS ON WAKEFIELD CASTROL!

No other oil in the world can claim such records as these:-

FIRST ATLANTIC FLIGHT BY AEROPLANE, 1919
FIRST ATLANTIC FLIGHT BY AIRSHIP, 1919
FIRST DIRECT FLIGHT ACROSS S. ATLANTIC, 1926
First Direct Flight to Australia.
The Flights of Survey to India, Australia, and round Africa by Sir Alan Cobham.
First Direct Flight Cairo to the Cape.
Mr. Bert Hinckler's 15½-day Flight to Australia.
The 35,000 Miles World Flight by Capt. Costes and Lieut. Le Brix.
The King's Cup Air Race and the Siddeley Trophy won five times.
The Duchess of Bedford's Flight to India and back in 7½ days
The Flight of the world's largest Flying Ship, the 6,000 h.p. 12-engined Dornier-Wal, with 169 passengers.
The World Flights of the Marquis de Pinedo.
The Air Altitude Record (12,739 metres by Herr Neuenhofen, May, 1929.)

Wakefield CASTROL Motor Oil is universally recognised as the pinnacle of lubrication achievement—the standard by which all others are judged. Over 230 Leading Motor Manufacturers show their recognition of CASTROL'S irreproachable quality by recommending it for the lubrication of their Products.

THE ROYAL AIR FORCE.

The London Gazette.

Air Ministry, December 17.

ROYAL AIR FORCE.

GENERAL DUTIES BRANCH.—Plt. Off. on probation T. Gadd is confirmed in rank (Nov. 1); Plt. Off. J. C. Allan is promoted to the rank of Flg. Off. (Nov. 25); Plt. Off. H. B. Maugham is promoted to the rank of Flg. Off. (Oct. 8, 1928) (substituted for the notification in the *Gazette* of Aug. 13, 1929).

Air Vice-Marshal F. C. Halahan, C.M.G., C.B.E., D.S.O., M.V.O., is placed on the half-pay list, scale A, Dec. 16 to Dec. 31 inclusive; Wing Cdr. E. R. Manning, D.S.O., M.C., is placed on the half-pay list, scale B, Dec. 14, 1929, to Mar. 31, 1930, inclusive.

Flt. Lt. A. Ferris is placed on the retired list (Nov. 28); Flt. Lt. E. S. C. Vaughan, M.C., is placed on the retired list on account of ill-health (Dec. 17).

Flg. Off. J. H. Parry is transferred to the Reserve, Class C. (Dec. 18); Flg. Off. B. C. Mason is transferred to the Reserve, Class C (Dec. 9). (Substituted for the notification in the *Gazette* of Dec. 10.) Plt. Off. on probation D. I. Carlyle relinquishes his S.S. comn. on account of ill-health (Dec. 18); Lt. C. B. Tidd, R.N., Flg. Off., R.A.F., ceases to be attached to the R.A.F., on return to Naval duty (Dec. 3).

ACCOUNTANT BRANCH.—Sq. Ldr. E. W. Gregory, M.C., continues on half-pay, scale A, during the period Nov. 5 to Dec. 17 inclusive; Sq. Ldr. E. W. Gregory, M.C., is placed on the retired list on account of ill-health (Dec. 18).

MEDICAL BRANCH.—W. J. Cotter, M.B., B.Ch., is granted a temp. comn. as a Flg. Off. with effect from and with seniority of Nov. 26; Flg. Off. B. A. Porritt, M.B., is transferred to the Reserve, Class D. (Nov. 27).

CHAPLAINS BRANCH.—The Rev. J. Black, O.B.E., M.A., is promoted to the relative rank of Wing Cdr. (Dec. 1).

RESERVE OF AIR FORCE OFFICERS.

GENERAL DUTIES BRANCH.—The following Plt. Offs. are promoted to the rank of Flg. Off.:—A. N. Spottiswoode (Sept. 27); G. R. M. Garratt (Dec. 14); G. Williams (Dec. 15). Flg. Off. L. W. Van Oppen is transferred from Class A to Class C (Nov. 15).

The following are transferred from Class C to Class A:—Flt. Lt. A. Haines (Dec. 17); Flg. Off. G. Rose (Oct. 28).

The following Flg. Offs. relinquish their comns. on completion of service:—F. L. Hudson (Aug. 29); H. Shaw (Dec. 7).

Plt. Off. E. F. Briscoe relinquishes his comn. on account of ill-health and is permitted to retain his rank (Dec. 18); Plt. Off. G. Leggatt resigns his comn. (Oct. 24).

Appointments.

Week ending December 21.

GENERAL DUTIES BRANCH.—Air Commodore A. M. Longmore, C.B., D.S.O., to H.Q., R.A.F., Cranwell, on appointment as Air Officer Commanding, 16/12.

Group Captain R. J. Bone, C.B.E., D.S.O., to Special Duty List, on appointment as Air Attaché, 2/12.

Squadron Leaders The Hon. R. A. Cochrane, A.F.C., to R.A.F. Staff College, Andover, 14/11. C. B. Dalison, A.F.C., to No. 3 F.T.S., Grantham, 9/12. J. W. B. Grigson, D.S.O., D.F.C., to R.A.F. Depot, Uxbridge, 14/11. H. J. Roach, A.F.C., to R.A.F. Depot, Uxbridge, 2/11. G. W. Bentley, D.F.C., to No. 203 Sqdn., 'Iraq, 7/12. A. McR. Moffatt, to R.A.F. Depot, Uxbridge, 1/12.

Flight Lieutenants E. Thornton, to No. 43 Sqdn., Tangmere, 9/11. E. C. Barlow, to C.F.S., Wittering, 12/12. C. B. R. Pelly, to H.Q., Fighting Area, Uxbridge, 9/11. D. L. Thomson, to No. 111 Sqdn., Hornchurch, 9/11. C. W. Attwood, to Wireless Station, Ismailia, Egypt, 6/12. J. B. H. Rogers, to No. 31 Sqdn., India, 20/11. R. E. Bain, to No. 1 (Indian Wing) Station, India, 14/11. R. S. Blucke, to Aircraft Depot, India, 20/11. H. F. Bradley, to No. 10 Sqdn., Upper Heyford, 6/12. J. J. Teasdale, to Air Ministry (D. of E.), 9/12. R. L. R. Atcherley, to No. 23 Sqdn., Kenley, 9/12. A. C. Sanderson, D.F.C., to No. 41 Sqdn., Northolt, 9/11. H. J. Gearing, to R.A.F. Depot, Uxbridge, 19/11. A. F. Scroggs, to A.A.E.E., Martlesham Heath, 26/11.

Flying Officers I. Hodgson, to No. 21 Group H.Q., West Drayton, 2/12. G. Lambourne, to H.Q., R.A.F., Mediterranean, 6/12. H. C. V. Jolleff, to No. 207 Sqdn., Bircham Newton, 9/12. A. G. Pickering, A.F.C., to Station H.Q., Hal Far, Malta, 1/12. D. M. Rees, M.B.E., to R.A.F. Depot, Uxbridge, 2/11. B. A. J. Crummy, to No. 58 Sqdn., Worthy Down, 2/11. F. Fazey, to R.A.F. Depot, Uxbridge, 2/11. W. E. Symonds, to Station H.Q., Manston, 4/12. F. W. Boggis, to R.A.F. Depot, Uxbridge, 2/11. C. J. Veevers, to R.A.F. Depot, Uxbridge, 9/11. D. J. R. Hylton, to R.A.F. Depot, Uxbridge, 9/11. G. Wood, to No. 100 Sqdn., Bicester, 26/11.

Pilot Officers H. L. McCulloch, to No. 30 Sqdn., 'Iraq, 15/11. R. M. Messiter, to No. 84 Sqdn., 'Iraq, 15/11.

MEDICAL BRANCH.—Squadron Leaders E. A. Lumley, M.C., M.B., to No. 3 F.T.S., Grantham, 10/1. W. G. L. Wambeek, to H.Q., A.D.G.B., Uxbridge, 20/12. D. G. Boddie, M.B., to R.A.F. Depot, Uxbridge, 2/11. C. P. Barber, to No. 2 F.T.S., Digby, 15/1. C. T. O'Neill, O.B.E., M.B., to Aircraft Depot, India, 9/11. J. T. T. Forbes, to R.A.F. General Hospital, 'Iraq, 9/11

Flight Lieutenants (Hon. Sq. Ldr.) J. W. H. Steil, M.B., to R.A.F. Base, Calshot, 8/1. G. J. Hanly, M.B., to R.A.F. Depot, Uxbridge, 9/11. C. G. J. Nicholls, M.B., to R.A.F. Depot, Uxbridge, 9/11. J. D'I. Rear, to R.A.F. Depot, Uxbridge, 2/11. P. H. Perkins, to R.A.F. Depot, Uxbridge, 2/11. M. J. O'Reilly (Dental), to R.A.F. Depot, Uxbridge, 2/11. J. Magner, M.B., to Aircraft Depot, India, 11/11.

STORES BRANCH.—Wing Commander E. J. Sayer, M.C., to R.A.F. Depot, Uxbridge, on transfer to Home Establishment, 14/11.

Flight Lieutenants R. Craig, to H.Q., R.A.F., Cranwell, 19/11. E. H. Eldridge, to H.Q., R.A.F., Cranwell, 2/11. H. T. H. Copeland, to Supply and Transport Services, 'Iraq, 6/12. L. N. Sargent, to No. 10 Group H.Q., Lee-on-Solent, 25/11.

Flying Officers F. C. C. B. Hichens, to No. 3 Stores Depot, Milton, 9/11. J. W. Mitchell, to No. 1 Stores Depot, Kidbrooke, 6/12. R. H. Clay, to R.A.F. Depot, Uxbridge, 18/12. W. A. D. Collingwood, to No. 501 Sqdn., Filton, 14/11.

ACCOUNTANT BRANCH.—Flight Lieutenant H. A. Murton, to Station H.Q., Upper Heyford, 26/11.

Flying Officers K. E. M. Holmes, to H.Q., A.D.G.B., Uxbridge, 2/11. G. Goodall, to No. 101 Sqdn., Andover, 12/12.

CHAPLAINS BRANCH.—The Rev. J. Lavin, to H.Q., 'Iraq Command, 29/11.

The School of Technical Training (Apprentices).

The Passing Out Inspection of the Aircraft Apprentices of No. 1 School of Technical Training, R.A.F., was held by Air Vice-Marshal A. E. Borton, C.B., C.M.G., D.S.O., Air Officer Commanding the Inland Area, on Dec. 17, at Halton.

In the course of his Report, the Commandant, Air Commodore I. M. Bonham-Carter, C.B., O.B.E., said that the Entry now passing out was the first to complete its course entirely under the system known as Wing Training. This was also the first occasion on which an advanced course for Corporals would not follow the passing-out of an Entry.

The Entry had reached a relatively high standard in each department and the results as a whole were an improvement on some previous ones.

The standard of drill and discipline had shown gradual improvement

MARCH DISCIPLINE.—Air Vice-Marshal A. E. Borton, C.B., C.M.G., D.S.O., Air Officer Commanding the Inland Area, R.A.F., at the Inspection, at Halton, on Dec. 17, of No. 1 School of Technical Training (Apprentices).

Digitized by Google

and particularly in certain respects—in steadiness on parade—dress and appearance—cleanliness of barrack rooms, and upkeep and lay-out of kit. The inclination to infringe the rules about smoking had been too frequently indulged.

The Entry had been well up to the average in games and the re-organisation of games within the Wing had introduced more competition and interest to lesser lights. More grounds had been made available.

The health of the Entry had been average. A small outbreak of scarlet fever had occurred in the Autumn of 1928. The incidence of rheumatism in this Entry had compared favourably with the records for other Entries. In order to reduce the time lost from instruction owing to sickness a form of light duty had been introduced for the benefit of Apprentices suffering from minor injuries.

Difficulties in accommodation or establishment, and usually both, had interfered with the training of the fitters,—aero-engine. The method of engine instruction was now based on the Heuristic method, the principle of which was that a boy learned more from practical work by himself than from anything he saw done. The standard achieved in basic work was very high. Instruction in engine running faults had been given on small Austin engines and this was a very satisfactory method. A special course of practical work on magnetos had been introduced with entire success.

This was the last Entry of carpenter riggers to be trained at Halton. The carpenter riggers had attended the aerodrome course at the same time as the fitters making it possible for Flight routine to be carried out on the same lines as normal Squadron practice.

Two Apprentices had been selected from the Coppersmiths and Sheet Metal Workers to demonstrate sheet metal working at the Model Engineer Exhibition held in London.

In Theoretical Education the results of the passing out examination had given abundant evidence of steady, persevering work throughout the course on the part of a large number of boys.

The Engineering Drawing tasks had again proved their value from the practical standpoint. The task gave the aircraft apprentice a chance to tackle a job on his own and he had to work against time.

The passing out of the Entry would bring into Service life a large number of keen and competent mechanics who, if carefully fostered for a time amidst the somewhat different surroundings of productive work, would prove their worth. With the exception of less than twenty, the whole of the Entry (384) had volunteered for airmen pilots.

Of the Entry forty-four had been classified as Leading Aircraftmen; two hundred and fifteen as Aircraftmen, first class; sixty-four as Aircraftmen, second class; six had not been examined owing to sickness and one had failed.

The prize winners were:—*Grand Aggregate*:—561094 Dale, G. T. (F.A.E.).

Highest in Educational Subjects:—561094 Dale, G. T.

Best Fitter Aero Engine:—561345 Pattison, C.; *2nd Best Fitter Aero Engine*:—561249 Holmes, W. A. P.

Best Carpenter Rigger:—561386 Weeks, G. W.

Best Coppersmith and S. M. W'kr.:—561324 Oxford, A.

Cadetships:—561094 Dale, G. T.; 561206 Porter, E. F.; 561326 Needham, S. W.

Wakefield Scholarship:—561094 Dale, G. T.

The Electrical and Wireless School.

The passing-out Inspection of the Aircraft Apprentices of the Electrical and Wireless School, R.A.F., was held by Air Vice-Marshal T. I. Webb-Bowen, C.B., C.M.G., at Cranwell, on Dec. 17.

In the course of his Report the Commandant, Group Captain A. L. Godman, C.M.G., D.S.O., said that there were 244 Aircraft Apprentices under training at the Electrical and Wireless School (exclusive of the Entry then passing out). Of these 110 were being trained as Wireless Operator Mechanics and 134 as Electricians.

The discipline of the Entry had been very good. They had set a high standard. All had satisfactorily completed their drill and had fired "A" of the Musketry Course.

In Technical subjects this Entry had made steady progress and had attained a good average standard. This was the more creditable bearing in mind the considerable dislocation of the move to Cranwell from Flowerdown and the real discomfort of the latter Station during the cold weather last Spring.

In W/T operating the standard had been well above the average and the ability to handle traffic speedily and accurately had been most marked during their examinations in the W/T out-stations. The Commandant prophesied with confidence that all the Wireless Operator Mechanic Apprentices would prove to be competent Ground W/T operators.

The advent of the new workshop equipment in the form of power-driven lathes afforded an incentive to produce better work.

Among other benefits the move to Cranwell had given far greater facilities to the pupils for evening study and practice. This entry had made full use of these facilities and had reaped great benefit from them.

In educational subjects the Entry had not attained quite as good a standard as the entry of January, 1926. The small difference was probably due to the severe weather and the widespread minor sickness in the term immediately before the examination.

Individual members of the Entry had done exceptionally well. four of the Apprentices had scored more than 75% in their three years' work. Forty-four of the Apprentices had done well enough to be exempt from compulsorary educational tests until their promotion to Serjeant became a matter of moment.

The health of the Aircraft Apprentices had been very good. The Entry had reached a high standard of physical training. The increased facilities of a drill hall, a gymnasium, and a swimming bath at Cranwell would enable the Junior Entries to benefit by a more comprehensive physical training course.

In Rugby football fourteen Apprentices of the passing-out Entry had played for the Squadron first XV. The Squadron had entered its Association first XI in the local Leagues. A most satisfactory keenness in Boxing and Shooting had been shown.

Of the present entry, ten had passed out as Leading Aircraftmen, thirty-five as Aircraftmen first class, sixteen as Aircraftmen second class and there had been no failures.

Cadetships had been offered to 561306 AA. R. Monks, 571317 AA. A. Pyke, and 561178 AA. E. W. Harries.

The Winner of the Hyde-Thomson Memorial Prize was AA. A. Monks, who also won the prize offered by the Air Ministry for the Aircraft Apprentice who obtained the highest aggregate marks in all subjects.

The Air Ministry Prize for the Aircraft Apprentice to obtain the highest marks in Technical Subjects has been won by AA. A. Pyke.

The Air Ministry Prize for the Aircraft Apprentice to obtain the highest marks in Educational Subjects had been won by AA. J. E. Patterson.

The Long Distance Attempt.

The R.A.F. Fairey (Napier) Long Range Monoplane which left Cranwell on Dec. 17, piloted by Sq. Ldr. A. G. Jones-Williams, M.C., and Flt. Lt. H. N. Jenkins, O.B.E., D.F.C., D.S.M., crashed near Tunis on the night of Dec. 17. Both the pilots were killed.

No authentic details have been received and although some of the messages refer to a storm the Air Ministry Meteorological Department have no record of any storm in that part of the World.

His Majesty the King has sent the following message to Lord Thomson, Secretary of State for Air:—

It is with much regret that I learnt of the disaster to the monoplane near Tunis resulting in the death of the two pilots, Squadron-Leader Jones-Williams and Flight-Lieutenant Jenkins, and I join the Royal Air Force in mourning the loss of two distinguished and gallant officers. Please convey to their families my sincere sympathy.

The Paris correspondent of *The Times*, in a message dated Dec. 19, states:—

According to a news agency message from Tunis, a preliminary examination carried out at Jebel-Zit [north-east of Zaghwan], where the Fairey monoplane was found, showed that the accident was probably due to a forced landing caused by engine failure. A clock found in the wreckage had stopped at 9.40 p.m. The bodies of the two airmen were taken this afternoon to Tunis in a military aeroplane.

PER ARDUA SURGO.—(The Motto of No. 45 (B) Sqdn.): On the left is one of the Fairey III.F (High-speed bomber) machines of No. 45 (Bomber) Squadron, R.A.F., at the end of the West African flight on Nov. 29. On the right is the Squadron Leader's machine just after landing with Sq. Ldr. Vincent and Flt. Lt. T. B. Prickman (navigator). Behind the machine is the R.A.F. standard flying at Helwan.

THE 1930 PILOT

THE 1930 Pilot will be a bit more exacting than his predecessors. He will not want to be one of a long list waiting to put in flying time, he will expect to fly whenever or wherever he wants. The 1930 Pilot will demand comfortable club premises and good hangar accommodation. He will ask for efficient service and low insurance rates. It will not be enough to have these at one aerodrome, he will want them at several all over the Kingdom. Therefore the 1930 Pilot will belong to National Flying Services: only this organisation can give him what he requires.

The pre-N.F.S. era is already obsolescent. Soon it will be pre-historic. For the history of private flying will be dated from the day the private flier first had available, facilities that turned private flying from a costly act of heroism to a reasonably inexpensive sport and a practical method of getting about. And so, although the 1930 Pilot will be exacting, he will be more numerous than his predecessors and will enjoy infinitely better facilities.

Write to-day for the N.F.S. booklet, which tells you all you may want to know concerning this important air organisation.

In the House of Commons on Dec. 19,—

Mr. Montague, Under-Secretary for Air, replying to Sir S. Hoare, Mr. Mander and Commander Southby, said that he was not yet in a position to add materially to the information already made public about the most regrettable disaster to the Fairey monoplane near Tunis. He added that the reports so far received from his Majesty's Consul-General in Tunis merely state that the machine crashed in the hills some 30 miles south of Tunis, the weather at the time being both cloudy and stormy, and that Squadron-Leader Jones-Williams and Flight-Lieutenant Jenkins were both killed. A military guard has been placed over the machine, and the Consul-General left at dawn this morning for the scene of the accident with a view to obtaining the fullest possible information and bringing the bodies of the dead officers to the military hospital in Tunis. The Air Ministry have already despatched a technical officer to Tunis, in order that the fullest expert inquiry practicable may be made on the spot. Pending receipt of his report no cause can be assigned to the accident.

I should like to add that the responsible French authorities have given the greatest possible assistance. I am sure the whole House will join with me in deploring the loss of the lives of two gallant officers of such outstanding promise and in conveying to their relatives an expression of the most profound sympathy.

The House signified its appreciation of the sentiments expressed.

The following telegram was despatched on Dec. 19 from the Government of the Union of South Africa:—

His Majesty's Government in the Union of South Africa has learned with the deepest regret that the R.A.F. Fairey monoplane in the non-stop flight from England to Cape Town has crashed and that both pilots have been killed.

The Union Government desires to convey to his Majesty's Government in the United Kingdom its deepest sympathy in this disaster and in the loss of the valuable lives of the gallant airmen.

Please also convey to the Chief of the Air Staff and to the relatives of the airmen the heartfelt condolences of the Chief of the General Staff, the Director of Air Services, and all ranks of the Union Defence Force.

The R.A.F. Display.

The sum of £14,145 12s., representing the net profits derived from the R.A.F. Display, 1929, has been allocated by the Air Council as follows:—

R.A.F. Memorial Fund, £9,000.

Officers' Association, £1,000.

R.A.F. Sports Board, £4,000.

Emergency Compassionate Fund of the Air Member for Personnel, £45 12s.

Hendon Urban District Council (for disbursement to local charities, £100.

Air Commodore B. C. H. Drew, C.M.G., C.B.E. (R.A.F., Retd.), has been appointed Secretary of the R.A.F. Display Committee with effect from Nov. 16, 1929, in place of Lieut.-Col. A. D. M. Browne, D.S.O., O.B.E.

Communications for the Display Committee should be addressed to the Secretary, R.A.F. Display Committee, R.A.F. Station, Hendon, N.W.9.

Boxing.

A boxing match between the Danish Amateurs and the Imperial Services at the Stadium Club on Dec. 12 resulted in a win for the Imperial Services by five events to three.

The R.A.F. Light Heavyweight, A. C. Munkley, beat Ebergard Hansen on points.

Inter-Services Squash Rackets.

The Army beat the R.A.F. in the Inter-Services Squash Rackets Tournament on Dec. 16 by five matches to nil. The results were:—

Capt. G. N. Scott-Chad beat Wing Cdr. F. L. Robinson by three games to none (9—4, 9—3, 9—0).

Capt. J. B. Hyde-Smith beat Flg. Off. F. G. Downing by three games to one (9—2, 9—3, 6—9, 9—4).

Capt. the Hon. B. M. O. S. Foljambe beat Flt. Lt. H. M. Mellor by three games to none (9—4, 9—3, 9—6)

Capt. T. H. Sweeny beat Air Cmdre. F. V. Holt by three games to none (9—2, 9—6, 9—2).

Lieut. W. M. S. Lillie beat Wing Cdr. A. G. Belfield by three games to none (9—1, 9—1, 9—3).

The match between the R.A.F. and the R.N. was played on Dec. 17 and resulted in a win for the R.A.F. by three matches to two.

The results were:—

Cdr. P. F. Glover, R.N., beat Wing Cdr. A. G. Belfield, R.A.F., by 3 games to 2 (7—9, 6—9, 9—7, 9—4).

Sub-Lt. G. S. Salt, R.N., beat Flg. Off. F. G. Downing, R.A.F., by 3 games to 0 (9—1, 9—3, 9—6).

Flt. Lt. H. M. Mellor, R.A.F., beat Lt.-Cdr. D. C. Hill, R.N., by 3 games to 0 (9—5, 10—9, 9—3).

Air Cmdre. F. V. Holt, R.A.F., beat Surg.-Cdr. K. A. I. Mackenzie, R.N., by 3 games to 2 (6—9, 9—5, 5—9, 9—5, 9—6).

Wing Cdr. F. L. Robinson, R.A.F., beat Lt.-Cdr. I. C. M. Sanderson, R.N., by 3 games to 1 (9—7, 3—9, 9—7, 10—8).

The Study of Japanese.

A six months' course in Japanese will begin at the School of Oriental Studies, London, during January, 1930. One or two officers from home commands will be selected to attend. They will be regarded as being on duty and will receive full pay and allowances during the course. If they qualify they will be eligible to be sent to Japan for a further course of study extending up to three years with a view to qualification as interpreters.

Officers desiring to attend should submit applications through the usual channels to reach the Air Ministry by Dec. 20, 1929. Officers not immediately available for the course, including officers serving abroad, may register their names with the Air Ministry for consideration for future courses. Volunteers should hold permanent commissions, be not over thirty years of age and be unmarried. If married they should have private means.

The Air Council attach importance to these posts being filled by officers of ability and promise.

Royal United Service Institution.

At the request of the Council of the Royal United Service Institution the attention of all Officers and Cadets of the R.A.F. is drawn to the facilities which the Institution offers for professional study and discussion.

Members are invited to forward papers on professional subjects of a non-confidential nature to the Editor of the *R.U.S.I. Journal*. Arrangements have been made for such papers as are accepted to be forwarded to the Air Ministry for permission for publication.

The Institution contains a fine professional library, reading and writing rooms, and an excellent museum.

The entrance fee is two guineas, and the annual subscription, which includes the use of the lending library and a copy of each issue of the *Journal*, is £1 5s. The fee for life membership is twenty guineas.

All Officers whose names appear in the current Air Force List can join without ballot by forwarding their entrance fee and subscription to the Secretary, R.U.S.I., Whitehall, S.W.1.

Air Ministry Land.

In the House of Commons on Dec. 16, in reply to a question by Major Pole, the Under-Secretary of State for Air said that the Air Ministry owned, in the British Isles, approximately, 25,000 acres, of which 16,000 were let to farming and grazing tenants, subject to R.A.F. uses. The names of the 73 stations concerned could be found in the Air Force List.

A NIGHT BOMBER.—A Hyderabad of No. 10 (Bomber) Squadron, R.A.F., returning to its aerodrome at Upper Heyford, Oxfordshire. No. 10 Squadron is commanded by Wing Cdr. A. T. Whitelock.—(*"Aeroplane" photograph.*)

THE ADDISON LUARD COURSE & WIND CALCULATOR

This Instrument is for solving the various trigonometrical problems that occur in Aerial Navigation, and is a definite improvement on all other types of Calculators since results are obtained automatically.

It is merely necessary to set on the appropriate scales the values of the known quantities, e.g., Wind Speed, Air Speed, etc., and the values it is desired to find can be read off immediately without further manipulation or calculation.

Two Models are available: Model "B," as illustrated, will solve problems when only three vectors are involved, but Model "C" is required when more than three vectors are concerned. Can be supplied with metric markings if required.

Model "B"—Type Av.886 :: Price **£10 10s.**
Model "C"—Type Av.887 :: Price **£21 0s.**

AERONAUTICAL ENGINEERING
SUPPLEMENT TO "THE AEROPLANE"

RACING SEAPLANES AND THEIR INFLUENCE ON DESIGN.

By R. J. Mitchell, A.M.I.C.E., F.R.Ae.S.

Quite a lot of information and experience is gained in the development of racing aircraft which is of undoubted value to the designer in all branches of aeronautical engineering and in many ways this has had a pronounced influence on the design of both military and civil types of aircraft.

During the last ten years there has been an almost constant increase of speed in our racing types. To maintain this steady increase very definite progress has been essential year by year. It has been necessary to increase the aerodynamic efficiency, and the power-to-weight ratios of our machines, to reduce the consumption, and the frontal areas of our engines; to devise new methods of construction; and to develop the use of new materials. The results obtained in the form of speed have been a direct and absolute indication of our progress in aeronautical development.

Speed in the air must always be a measure of aerodynamic efficiency, which in turn must always be the most important consideration in all aircraft design. The special requirements of racing aircraft are very exacting. All the design requirements appear to be opposed to the production of speed. The most efficient racing machine satisfies these requirements with the smallest possible margin.

Under our present state of development the ideal racing machine must have only just sufficient excess propeller-thrust to overcome its resistance on taking-off, otherwise we are sacrificing propeller efficiency under top speed conditions.

Its floats must have only just sufficient reserve buoyancy to enable it to hydroplane, take-off and land reasonably safely, and to give it sufficient static stability. If these requirements are overdone we are sacrificing speed due to excess weight and excess air resistance of floats.

Tankage for petrol and oil and cooling surface for water and oil must be only just sufficient to feed and cool the engine, or further loss of speed will result.

The attainment of these happy results is sometimes assisted by the engine developing more horse-power than has been assumed in design conditions, or by the machine coming out over weight and thus working a little nearer to the limits than intended. But provided the final result is as indicated the means of attainment is of secondary consideration.

Working to very close limits demands a very accurate investigation of every detail and leads to more definite knowledge concerning the satisfaction of requirements than is obtained in the design of more conventional aircraft in which larger margins of safety can be allowed.

It will only be possible in this short article to touch very lightly on the interesting points which arise in the development of racing aircraft and the influence of some of them on the design of conventional types.

The taking-off characteristics of racing seaplanes form a very interesting subject.

Taking-off is becoming one of the most difficult requirements to satisfy. As we increase speeds this difficulty increases. This appears contrary to expectations, as one would expect at first thought that taking-off would become easier as we decrease our weight per horse-power, and that there would be a very large reserve on a machine with a horse-power loading of less than three pounds.

In Fig. 1 are given curves of propeller-thrust and of total resistance of machine for the S.6 seaplane, starting from rest and up to the top speed condition. It will be seen that there are very wide variations in the excess of thrust over resistance and at two points before take-off this is well under one hundred pounds.

One point is at the hump-resistance of the floats and the second point is just before take-off. This second point is not experienced with normal types of seaplanes as they usually have plenty of reserve thrust throughout their take-off if they have sufficient to get over the hump resistance.

There are two main causes for this second point of "stickiness." The first is due to the special characteristics of the propeller. Starting from rest the propeller is working at angles of attack considerably larger than the stalling-angles of the sections. Its thrust per horse-power is therefore extremely low. As forward speed is gained the angles of attack are reduced and the blades become less stalled thus working at a higher lift coefficient. This causes a reduction in the revs. per minute, and still further lowers the thrust. The stalling point of the blades occurs at about the take-off speed at which point the revs. and thrust are lowest. After this there is a very rapid increase in propeller efficiency.

The second cause is due to the high taking-off speed. The water resistance of the floats remains abnormally high right up to the point of take-off, when practically all the weight is taken on the wings. This is due to the very high frictional resistance at speeds of about one hundred miles per hour.

These taking-off characteristics seem to indicate that it will be necessary to use a variable pitch propeller before very much higher speeds are attained with racing aircraft, and that, as the speeds of service types increase, the variable pitch propeller will become correspondingly more important.

Very extensive progress has been made in engine design. During the past few years the weight-per-horse-power of our racing engines has been reduced by fifty per cent., and the frontal area per horse-power has been halved. A large proportion of this progress has been passed on to standard engines used in Service and civil craft.

It is quite safe to say that the engine used in this year's winning S.6 machine in the Schneider Trophy Contest would have taken at least three times as long to produce under normal processes of development had it not been for the spur of international competition. There is little doubt that this intensive engine development will have a very pronounced effect on our aircraft during the next few years.

Progress in seaplane float design during the last few years has been very largely due to the practical experience gained from the operation of our racing craft and to the intensive research work in wind channel and tank that has been found necessary to satisfy requirements. It is difficult actually to compare the efficiencies of various types of floats as they depend on a number of factors, such as water re-

FIG. I.—Curves of propeller thrust and of the total resistance of the Supermarine S.6 seaplane.

Digitized by Google

sistance, air resistance, seaworthiness and weight. The figures given in Table I, however, will serve to indicate that considerable progress has been made in float design.

TABLE I.

Comparative Weights and Air Resistance of Floats.

	Wt. per 1,000 lbs. wt. of aircraft.	Air resistance at 100 ft. a sec. per 1,000 lbs. wt. of aircraft.
S.4 (Wood)	108	3.08
(Metal)	115	3.08
S.5 (Metal)	110	2.72
S.6 (Metal)	95	2.42

It is interesting to note that a few years ago the flat-bottomed box-section type of float with a spring chassis was almost universally used. This type has now almost disappeared, and has given way to the well-known Vee-bottomed and round-top-sided type developed for our racing craft.

This modern type of float requires no shock-absorbing devices in its chassis, is more seaworthy, can be built lighter and has very greatly reduced air resistance.

Flying-boat hulls have shown similar improvement in seaworthiness, air resistance and weight.

The radiators developed in our racing craft for cooling water and oil have shown more progress than any other characteristic, and form a highly potential source of improvement in general aircraft design.

In Table II figures are given comparing our standard honeycomb radiators with the various other types of radiators which have been produced.

TABLE II.

Comparison of Radiator Efficiencies.

Figures for Standard Honeycomb 10 x 120 m.m. tubes taken as 100 in each case.

Constant speed taken in each case.	Honeycomb.		Wing Surface Type.			
	Standard Hexagonal 10 x 120 m.m.	Long Tube Hexagonal 10 x 360 m.m.	Externally Corrugated Brass.	Externally Flat Brass as "S.5."	Externally Flat Dural as "S.6." Without internal cooling.	Externally Flat Dural as "S.6." With 12% internal cooling.
Wt. of radiator per h.p. dissipated	100	179	300	410	75	67
Resistance per h.p. dissipated ..	100	76	15	0	0	0
H.P. dissipated per unit of cooling surface	100	58	50	66	81	92

These figures may require a little explanation. The first of the wing-surface type radiators described in the table as the externally-corrugated brass radiator is the type first used by the American racers. This type adds a considerable amount of resistance, owing to the external corrugation increasing the area of surface and thereby adding to the frictional drag. It is placed over the wing-covering of wood or metal and is about three times the weight of a corresponding honeycomb radiator.

The next development of wing-radiator is the type as used on the S.5 seaplane. This has a flat outer surface and therefore adds no direct resistance to the machine. This is still heavier, however, than the externally-corrugated type owing to the necessity for covering a larger area of wing. It also is placed on top of the wing-covering of wood or metal.

The next development is the type as used on the S.6 seaplane. This type is made from thin duralumin sheets formed into a double skin with a water-space of 1/16th of an inch between. This double skin is fixed to the spars and ribs of the wing and forms the wing covering. It is strong enough to stiffen the wing to resist torsional stresses.

The dual purpose of radiator and wing covering saves very considerable weight, and the added weight due to the radiator is very small. This type has the further advantage of placing the whole of its surface in contact with the cooling water; thus increasing its cooling efficiency per sq. ft. of surface.

A further development in this type of radiator is that of internal cooling,—which was used on the S.6 seaplane. Small air-intakes were placed at the wing-tips, opening in the direction of air flow, and allowing air to enter the wing. Exhaust ports were placed at the wing-roots, exhausting the air from inside the wing. A flow of air through the wing at a velocity of about thirty-five miles per hour was obtained in this way, and the inside surface of the radiator covering was used for cooling purposes in addition to its external surface.

This internal cooling was responsible for an increase of about 12 per cent. in the cooling capacity of the radiators. No loss of performance could be traced to this induced air flow inside the wing.

It is not outside the bounds of possibility that by [illegible] the air inside the wing at certain positions at the wing [illegible] an improvement in the wing characteristics might be [illegible] tained. Further investigation on this point might be carried out with advantage.

The last column in Table II gives the comparative figures for the S.6 type of radiator, allowing for the increase due to internal cooling.

These figures show that a water-cooled engine can be cooled without adding any air-resistance to the machine and by the addition of only seventy per cent. of the weight of a corresponding honeycomb type of radiator.

Our experiments on radiators indicate that with the development of evaporative cooling it will be possible to use metal-covered components of a machine such as wing floats and sections of fuselage, as steam-condensers, without the addition of any internal gear,—except to drain off the condensed water and return it to the engine. This would simplify cooling systems and greatly assist ease of maintenance, thereby making them more suitable for conventional types of civil aircraft.

The advantages to be gained by the "no resistance cooling system" are indicated if the figures given for radiators are applied to an engine nacelle as used on outboard-engined machines, using the horse-powers available from standard types of water-cooled and air-cooled engines. A comparison is shown in Table III.

TABLE III.

	Lbs. Resistance at 100 ft./sec. per engine h.p.
Air-cooled engine nacelle	.12
Do. with Townend ring ..	.068
Water-cooled engine nacelle with radiator to cool at 140 m.p.h.	.081
Water-cooled engine nacelle without added resistance for cooling	.03

The question of interference-effects between component parts of a machine has been thoroughly investigated in our search for methods of reducing resistance on our racers.

In Table IV figures are given for the interference effects between components of the S.6 seaplane. It is indicated that if suitable precautions are taken the added resistance due to interference can be limited to that caused by struts and bracing.

TABLE IV.

Percentage Interference Effects between the Component Parts of the "S.6." Seaplane.

Figures in italics are the added interference resistances due to the addition of the relative component.

Total resistance due to interference	16.4%
Resistance due to interference of struts and bracing	18.1%

Other points which can be mentioned on which our racers have supplied us with useful information are as follows:

The ventilation cooling, and heating of cockpits at high speeds.

The dissipation of heat from water and oil with various types of radiators and at high air speeds.

The effects of high centrifugal loading, as when turning, on the correct functioning of petrol systems.

The production of streamline-section bracing wires.

Problems of control at high speeds, and (last, but by no means least) the great value of close co-operation between engine and machine designers.

DIESEL ENGINE DEVELOPMENTS.

The Fairbanks-Morse Company, U.S.A., makers of marine Diesel engines, are reported to be developing a Diesel aero-engine in their works at Beloit, Wis.

In a recent flight from Detroit to Indianapolis, an aeroplane with the Packard Diesel engine covered the 320 miles using only 8 gallons of fuel costing $0.32 (1s. 4d.) at existing American retail prices for crude oil.

THE CANTILEVER MONOPLANE AGAIN.

The apparent neglect by British aircraft firms of the cantilever monoplane has long been a source of surprise and also disappointment to the writer. Surprise because it is rather unlike our peculiar race not to copy and improve on the successful designs of other countries, and disappointment because the cantilever monoplane is, or can be made, such a very much more beautiful flying-machine than the existing strut-and-wire biplanes.

However, before expressing his views on this interesting subject, the writer would like to point out that, although he is what is known as a "Nark" (R.A.F. slang for a chap interested in the development of flying machines and their accessories), yet he must emphasise the fact that he is not a mathematical nark; and therefore his opinions can carry but little weight, as they are not backed up by formidable rows of dy/dx, etc.

But the opinions of even such a one may have the desired effect of causing the brainy ones to take thought and argue one with another and produce the dy/dx.

The cantilever monoplane has been, up to the present, almost the sole monopoly of the Germans, who seem to have concentrated on the type. Also, from all accounts, they seem to have no intention of reverting to the braced biplane type. Indeed the German (and Dutch exemplified by Mr. Antony Fokker) ideas seem to be spreading across the North sea and also across the Atlantic. For what is the Ford machine but a Fokker? And so is the Avro. And the doctrine of Professor Junkers has inspired many an American designer. Very beautiful machines they are too. Machines that look right usually are right.

The writer does not suggest for a moment that the British biplanes are inferior in any way either in performance or strength to the more beautiful foreign monoplanes. On the contrary, he believes that the home-produced machines are usually the superior. But he does believe that the line of future development lies rather more with the monoplane.

The German and Dutch engineers are no fools. Yet with few exceptions our firms are content to carry on in the old way with the strut and wire type.

The chief difficulty of the designer of the internally braced monoplane seems to be that of combining sufficient strength with a structure-weight low enough for the machine to be able to compare favourably with the braced type for payload and performance. And the chief difficulty in the strength problem is that of providing sufficient resistance to torsional vibration of the wing. This, of course, is of supreme importance in machines designed for high performance and extreme manœuvrability.

The writer is open to correction but he thinks that, so far, there is no really successful and proved cantilever monoplane fighter. Certainly no such type has been adopted by any Service yet. Even Mr. Fokker had to use "Torsion struts" and make his cantilever fighters into biplanes (although still cantilevers).

The problem of torsion becomes less acute when the machine is large, and not subjected to violent aerobatics, and so the monoplane is used for big machines.

Up to the present the most general method adopted for resisting the tendency of the wing to twist has been that of using stiff covering for the wing. This method is adopted by Fokker, Wibault and Rohrbach. The rigid skin of the wing stabilises the spars and also helps to take the bending loads. This type necessitates at least two spars and the "active part" of the wing structure is in the form of a rectangle in section.

Then there is the system of the multispar, interbraced structure, developed by Professor Junkers. This also apparently needs a fairly rigid skin to help counteract the torsional loads. Both these systems are well tried and successful but would appear to be very heavy.

About a year ago a very interesting development occurred. A large English cantilever monoplane of some 80 ft. span appeared and soon proceeded to prove its worth by doing a non-stop flight to India. Much to the amazement of the Continental designers the wing of this large and heavily-loaded Fairey monoplane was covered with ordinary fabric.

It was found that the machine had two ordinary wooden box-spars taking the load, with a system of steel pyramids between the spars to resist torsion. These pyramids had their bases on the bottom of the spars, and so provided an exceedingly ingenious and calculable torsion resister. This last point is important because it seems to be rather beyond the mathematical narks to calculate the torsion resistance of a skin covering.

Then a little later, there appeared the very interesting and promising design of Mr. Stieger of the Mono-Spar Wing Company. This wing uses one spar only and that spar is braced against torsion in a manner very similiar to that employed in the Fairey Monoplane. The difference was that the pyramids are made of wire and therefore double-opposed, with struts taking compression, and also the bases lie in the vertical instead of the horizontal plane.

But to the ordinary lay mind the two systems are almost the same. However, the Mono-spar people claim that by the use of one spar placed at the greatest depth, it is possible to build a more economical girder to resist the bending loads than by using two spars of lesser depth. This would appear (again to the lay mind) reasonable and true although perhaps a mathematician might be found who could disprove it. Also the Mono-spar would appear to be a simpler thing to construct and also possibly cheaper than two spars.

Unfortunately very little seems to be known about it and the writer does not know of a successful aeroplane which employs this principle. Being convinced of its soundness he wrote to Mr. Stieger and urged him to demonstrate the principle by making, not a huge stately weight-carrier, but a small cheap aerobatic machine. Obviously, if the principle will stand advanced aerobatics, it will also trundle passengers sedately through the sky. The writer even offered to test such a machine if made, but unfortunately got no answer to his letter.

However, it is possible that this principle is being tried out and may soon appear in concrete (or preferably alloy) form. The writer, with great diffidence, now ventures to offer a suggestion towards this interesting problem.

The suggestion is that a mono-spar type of construction be employed on account of its obvious weight-economy as a beam, and also because of its ease of manufacture. Then that this beam should be surrounded by a light-section tube which would take the torsion and drag loads.

This tube, tapering with the beam inside it, might be made in two halves, rivetted at top and bottom, would be suitably ridged to avoid buckling, and might also have tubes running through it in a horizontal plane to serve the double purpose of supporting the web of the beam and resisting the buckling tendency of the tube.

It would appear that such a structure might have distinct possibilities, particularly from the point of view of mass-production. Mr. Farren, in one of his very able papers states that, "in a structure such as the Junkers the torsional strength is probably not very different from that of a circular tube of the same cross-sectional area as that of the wing and of the same wall thickness."

The tapered-tube torsion-member is also discussed by Mr. Duncanson in a paper on cantilever wings. This article was most interesting to the writer as he had carried out a very rough experiment by constructing two model spars of steel, and reinforcing one against torsion by welding on a series of steel pyramids and the other by rivetting a conical tube around it. The weight of the spars and the torsion-resisting members were identical and, on test for torsion, the tube won easily.

After this appeared the article by Mr. Duncanson, who reached quite a favourable conclusion mathematically with the tapered tube. It has an added advantage that a part of it can be employed as a petrol tank, which would be a great saving of weight especially in a machine such as the Fairey.

In fact the tubular torsion-member with beam inside has the following advantages:—

1. As a beam it is deeper, therefore more economical than the two spar structure.
2. It is cheap and easy to make. The beam is large and simple and the tube could be easily and cheaply made. One could imagine a machine which could stamp out the separate halves.
3. The tubular member reinforces the beam instead of taking torsional loads only.
4. The tube takes drag-loads also. (This would appear good engineering to make one member serve three or more purposes.)
5. The tube would not be so subject to stretching as the wires of the tension pyramid (Stieger) system.
6. The tube or a part of it would serve as a petrol tank. This would save the weight of a petrol tank and its fittings and minimise fire risks.
7. A mono-spar wing is a suitable type to house a folding undercarriage, or anything else which might be disposed in the wing.
8. It is a simple, straightforward structure, devoid of bits and pieces, fittings, wiring, rigging and trueing, will maintain its truth without attention, and is easily calculable.

The writer hopes that before long the mathematical narks will be stimulated to discussion, but, all the same, he is convinced that it would be well worth trying out as it has so many practical points.

It would seem that the best way of settling the argument would be to construct model wings, all of identical weight, on the Junkers, Rohrbach, Fokker, Mono-spar, Fairey and tubular systems and test them. Perhaps some public-spirited constructor may do this. The cost should not be so very much.—H. V. R.

THE DEVELOPMENT OF METALS FOR AIRCRAFT PURPOSES.

On Dec. 12 Dr. Rosenhain, who is a Fellow of the Royal Society and President of the Institute of Metals, gave a lecture before the Royal Aeronautical Society on the Development of Metals for Aircraft Purposes. Dr. Rosenhain has been Superintendent of the Metallurgical Department at the N.P.L. since 1906.

The object of the lecture was to survey on broad lines the general trend of development and to estimate the present direction and future tendencies of such developments. The lecturer confined himself to the three groups of materials which are especially interesting to the Aircraft Industry. These three groups are the various steels, the alumainium alloys, and the very light alloys such as those based on magnesium.

These materials were considered under the headings of strength-weight ratio, stiffness, resistance to fatigue, resistance to wear, resistance to corrosion, strength at high temperatures, and ease of working.

DR. ROSENHAIN, who spoke extempore and with few notes, opened by explaining that when he was asked a month ago to give the lecture and in it to forecast future metallurgical developments, he replied that such a forecast was not possible. All one could do was to follow present developments and see therefrom a general tendency.

He found it easier to discuss what had been done and was being done rather than what might be done. He was not going to give many figures, as this had been done in a number of previous lectures each specifically devoted to one subject.

The Aircraft Industry, he said, makes exacting demands on the metallurgist. He talked of materials rather from the point of view of the properties required than of the materials themselves.

Aircraft materials because of the high strength-weight ratio required need more precaution in their development and are more expensive than materials produced for commercial purposes. We have to take a great many precautions to-day on a basis which is by no means secure. Whenever you have insufficient knowledge you pay for it by excessive precautions and consequently excessive price.

The development of aircraft materials are at once a source of joy and a source of sorrow to the metallurgist. Joy because he is not bound by considerations of cost, and sorrow because of the exacting requirements he has to meet, continuously, uninterruptedly, and always reliably.

It is a great mistake to rely too much on strength as estimated from the tensile tests. Even the impact test, such as the Izod, is only a measure of the work done in producing rupture. If you take a piece of antimony and a piece of hardened steel and made an Izod test on each, in both cases you get zero result.

While talking of the alloy steels which have a very high strength-weight ratio, Dr. Rosenhain referred to specific tenacity, which he defined as the strength in tons per sq. in. divided by the specific gravity. In the case of an 80-ton steel this figure is 10. A figure of 11 or 12 can be got, but only at the expense of ductility.

The cause of strength in a steel is the manner in which the interior structure is arranged. This is affected and effected both by the addition of other metals and by heat-treatment.

Among the aluminium alloys, duralumin has been dominant for the last fifteen years. This does not mean however that there has been no improvement. New casting materials have been developed. The possibility of increasing the tensile strength to 39 or 40 tons per sq. in. has been demonstrated experimentally.

The lecturer said that he was particularly anxious not to discredit the very light alloys such as those of magnesium. But to compare an alloy which has an elongation of 2 or 3 per cent. with an alloy steel which has 30 or 40 per cent. is absurd. By cold working, which will sacrifice a certain amount of ductility, the specific tenacity of aluminium alloys can be raised considerably above any figure for the magnesium alloys.

The lecturer said he was of the opinion that a certain amount of ductility was essential in a material. Specific tenacity must be measured in conjunction with elongation. He then showed a slide on which this point was illustrated numerically, and showed the advantage duralumin possessed in view of its greater ductility.

Dr. Rosenhain then turned his attention to Beryllium, which is beginning to attract attention because of its high strength-weight ratio and apparent resistance to corrosion. At the moment this material is very expensive, as though it were for jewellery. But as Tungsten was once highly priced and is now comparatively cheap, so will Beryllium probably become cheaper until it was perhaps twice the price of tin [now £183 per ton].

Although the new metal as at present produced has no ductility, Dr. Rosenhain is convinced that this feature can be obtained. The strength-weight ratio promises to be two or three times better than the best of the alloys to which previous reference has been made.

As regards corrosion, the material has so far not been produced in sufficient quantity to make adequate tests, but a laboratory specimen has retained its polish for a considerable time. Some Beryllium steels may shortly be available.

The lecturer said that stiffness depends on the elastic modulus of a material which is generally measured as the load required to double the length of the test piece. The elastic modulus for steel is about 30 millions, about 11-12 millions for aluminium alloys, and six millions for magnesium alloys. Alloys differ but little from the pure metals in the possession of this quality. A 3 per cent. addition of Beryllium to Copper increased the elastic modulus of the latter by 60 per cent. after age hardening.

Talking about resistance to fatigue, Dr. Rosenhain said that vibration is not responsible for damage unless the oscillations are large enough to put serious stresses into the material. In steels the fatigue range has a pretty definite ratio to tensile strength. The fatigue range in ultra light alloys is very low and remains to be investigated.

McAdam has recently completed a lot of work in America which illustrates the effect upon the resistance of a material to fatigue. The lecturer showed on a slide a number of test pieces of steel which had been heat-treated to different strengths, all failed at the same greatly reduced level when subjected to the corrosive effect of ordinary tap-water. But rust-resisting steels were immune from this feature.

In this connection the condition of the surface of springs is of the greatest importance and the strength can be considerably increased by grinding the surface. The lecturer said he would rather rely on the poorest spring steel which had a ground surface than the finest which had been left with a rough surface.

Corrosion in aircraft where it is accelerated by wind pressure is very important. Rust-resisting steels solve the problem, but they lack a high enough strength-weight ratio. It may be possible to overcome this by coating high-alloy steels with a layer of rust-resisting steel.

Such a method has actually been tried out with duralumin where this material is so treated that a layer of pure aluminium is formed on each side of the sheet. This has the disadvantage that such a sheet is manipulated in various ways during fabrication which tends to make the coating of no advantage. In any case a surface coating is a counsel of despair.

The Germans have produced an aluminium antimony alloy which forms a protective coating when immersed in sea-water which prevents further corrosion.

Resistance to wear is specially important in aircraft engines which are run very nearly at maximum speed, which means that the bearing surfaces are heavily loaded.

Specially hard surfaces for resisting wear may be got by case-hardening or nitriding. This latter process results in a very hard surface but requires the use of a special aluminium steel. The machined part is exposed to ammonia vapour at 500 to 600 deg. Cent. for a considerable period. There is no distortion, as quenching is not needed.

Another method of hardening is the "Cloudburst" method of Mr. Herbert, in which the part to be hardened is subjected to a deluge of small steel balls. [This method is also used for hardness testing and was described in Mr. Johnson's paper read before the R.Ae.S. on Nov. 21 and reported in THE AEROPLANE of Nov. 27.—ED.]

Materials of extreme hardness are the tungsten carbide mixtures such as "Carballoy," which are especially used for the tips of machine-tools. A layer of such materials placed over steel parts will allow much greater bearing-pressures to be used.

Materials which have to resist heat must not burn or scale. Dr. Rosenhain said that he thought that insufficient recognition has been made of the great development by the Steel Industry at home and abroad of the heat-resisting steels.

If we take one of these heat-resisting steels and test it in the ordinary way we shall get a certain figure. If we take it up to dull red heat (700 deg. Cent.) and test it we shall get a figure not very much lower, but if we apply a very much smaller load at this temperature and leave it these steels will break after a certain time. An alloy has been produced at the N.P.L. which is a considerable improvement on existing steels of this calibre.

Dr. Rosenhain thinks that the development of such steels will be valuable aids to the production of an internal combustion turbine. At first one would construct such a turbine to utilise the exhaust gases. Then the turbine would be developed until the turbine produced all the power and the engine was only a combustion chamber.

The development of these new materials must obviously call for new methods of production and manipulation. The super-hard materials will require new cutting tools. The lecturer mentioned that he has seen toughened manganese steel being machined like mild steel with special cutting tools, the tips of which were made of the tungsten carbide mixture previously mentioned. In the United States special high-speed lathes with light cuts and feeds were being produced for use with these super-hard cutting tools.

With reference to the jointing of materials the lecturer mentioned the cadmium-zinc solders which can be used with the alloy steels and yet fuse at low enough temperature to avoid impairing the temper.

Welding is popular because of its speed, its convenience, and its weight-saving properties. But there is the trouble of the impossibility of knowing what happens inside each weld. There is also the trouble of *the welded material being in the cast and not the wrought state.*

Various methods are being tried out for the non-destructive testing of welds. There are magnetic and electrical methods, but the simplest is that now being tried in America. An ordinary medical stethoscope is used and the weld is tapped with a light hammer, any irregularity inside is easily detected by the difference in sound.

The application of heat to the weld considerably reduces the strength of the metal. In most cases the metal cooling down slowly tends to soften the metal at some distance from the weld. It is at this point that fracture occurs, and so people say that the weld is stronger than the material, which is not entirely correct. [See THE AEROPLANE any time for the past 14 years.—in spite of ridicule and opposition. This is the first time that a metallurgist of note has rubbed these simple truths into the lovers of welding.—C. G. G.]

The ideal is to heat-treat after welding, but this is obviously only possible with small parts. There is likely to be some progress in the welding of duralumin. Weldable alloys will probably be developed which will assume their best conditions on cooling.

Dr. Rosenhain closed his lecture by saying that he had endeavoured to give a picture of the position as it appeared to a metallurgist. He laid stress upon the value of investigation and scientific research which supplies the materials with which the non-scientific inventor may build his edifice. Dr. Rosenhain's final words were at once a plea for and justification of basic research.

The Discussion.

Colonel the Master of Sempill said, after some complimentary remarks, that most of those concerned with the development and production of the materials to which Dr. Rosenhain had referred were present, but he would first call on Mr. Pye, Deputy Director of Scientific Research at the Air Ministry, to open the discussion.

One mentioned in the last report of a lecture that speakers were so much more easily heard if they spoke from the dais. Mr. Pye set everybody a good example by doing this, it was only towards the end of the discussion that people stayed in their places to speak.

Mr. Pye expressed his gratitude for the paper, on which he congratulated the lecturer. He found his horizon had been considerably widened during the lecture. He agreed with the lecturer that all aeronautical progress depended on research.

He thought that most aeronautical improvements were due to improvements in material such as the development of 100-ton steel. He referred to the need of a Publicity Department to make the Industry generally acquainted with scientific results.

Research must be undertaken with a full knowledge of the technical difficulties borne by the Industry. He would like the comparative figures for aluminium alloys and magnesium alloys based on .1 per cent. proof stress.

He was glad to have so much definite information about Beryllium because such an attractive material was liable to produce misstatements. He referred to conversations he had had with Dr. Illing of Siemens-Halske, which was the German firm closely identified with the production of the new metal. Dr. Illing quoted a price about the price of gold (about £25 per lb.) for small quantities for laboratory work. Dr. Illing thought the price would never be less than the price of silver. Mr. Pye therefore thought that Beryllium would have its greatest field as a low per cent. alloying element. The addition of 1 per cent. of Beryllium would raise the strength of stainless steel to 85 tons per sq. in.

Dr. Atchieson, the Chief Metallurgist to Booths, the makers of Duralumin, and the authority on non-ferrous metals, was the next speaker. He referred to the need for better protection against corrosion. He said that there were no known stainless alloys of aluminium or magnesium. He would hate to think that anodic oxidation was the last word in surface protection. He did not think that the production of Alclad (a duralumin with the aluminium coating) would do much to simplify the difficulty, as from its nature it could only be used as sheet. It could not be supplied in extruded or tubular form or as drop forgings.

Referring to welding, he said he thought that the chief reason for its use was to avoid the troubles of rivetting. He referred to the advantages of using extruded sections of aluminium alloys. The use of such sections saved much rivetting. He thought that there was every likelihood of aluminium alloys getting stronger. He thought that wrought materials were far more important than cast.

Major Wylie said that a reason for the use of welding was to save work in the drawing office. This was specially so in America.

Mr. Sutton regretted that no advance copies of the paper were available, as it was difficult to join properly in discussion without this advantage. He had hoped to hear more of what were the desirable physical qualities in any material. He queried the usefulness of specific tenacity.

Referring to the development of high-speed steels resistant to corrosion, he said that rustless steel tubes and fittings were already in use on aircraft. Chrome-molybdenum steel and manganese steel tubes slightly cold-drawn had been found to age-harden and were therefore useful for welding. He would like to have the analyses of the steels the figures for which were shown for the strength at high temperature test. He asked whether the resistance of Beryllium to corrosion was not over-rated.

Wing Cdr. T. Cave-Browne-Cave, C.B.E., said that bearing materials were not mentioned and there was the likelihood of these having to be replaced. The high M.E.P.'s necessary in compression-ignition engines resulted in high bearing pressures. He suggested that the forming of a Department of Scientific Publicity might take the form of a grant to the R.Ae.S.

Captain Swan, of the R.A.E., Farnborough, referred to the difficulty of replacing highly stressed steel parts in internal combustion engines by light alloys. A reduction of density generally meant a reduction in strength, yet if the strength could be maintained and the weight of the parts be reduced it would be possible to run the engines at higher speed. Although it had been suggested that the cost of such alloys would be prohibitive, if the actual cost per h.p. were less, the increased material price would not matter.

Mr. Radcliffe, speaking for drawing-offices generally, said that there was a disinclination to use materials other than the well-tried variety. This lecture was an urge to try new things. Referring to welding he said he understood that the U.S. Government had built a heat-treatment chamber of large dimensions in which a complete fuselage might be normalised. He was glad to hear about the latest materials for new cutting tools, but every time the drawing office endeavoured to use new steels of the H.T. variety the workmen said such steels increased the cost.

Mr. S. L. Archbutt, a former colleague of Dr. Rosenhain, said he thought that the magnesium alloys had been rather roughly treated in the lecture. He thought that such alloys had a definite range of fatigue resistance.

Dr. Rosenhain, replying, said with reference to the Department of Scientific Publicity suggested by Mr. Pye and Wing Cdr. Cave-Browne-Cave, that commercial practice did lag far behind. Y-alloy was discovered in 1917 and it was only now (12 years after) that this material was coming into general use. Between 1906 and 1916 aluminium bronze was discovered by Prof. Carpenter and yet people in this country could never obtain any commercially. For years this material was used in various parts of Ford trucks and for other purposes.

He did not think that Industry as a whole was far-sighted,—all developments were forced on it by the basic research worker. He did not think that the desirable properties of any material could be expressed in a single figure of merit. Magnesium alloys had a definite range but he did not think this was any definite advantage. The discussion of bearing metals would lead one so far afield that he had not touched upon the subject at all. As bearing pressures went up so would white metals become unsuitable and would have to be replaced. Aluminium alloys could be used and were already being used in certain engines outside the aeronautical industry. Although the cost of the raw Beryllium material was not likely to decrease much, a process of manufacture had been developed in this country which was no more expensive than that used for aluminium.

THE SWINGS AND THE ROUNDABOUTS.

[*The Strength of Shafts in Vibration.* By J. Morris, B.A., A.F.R.Ae.S. 190 pages 9½ in. by 7½ in. Crosby Lockwood & Son. Supplied by The Aeroplane Book Department, Cannon House, Pilgrim Street, E.C.4. 30s., plus postage.]

Periodic vibration has proved to be the cause of unexpected failure for the engineer since the beginning of modern engineering.

The first experiences were those concerned with bridges failing when troops marched over them without breaking step. Later, when the mechanical engineer began his work, speeds, at which belts flapped and broke, at which ships shook from stem to stern with engine vibration, at which railway locomotives either broke their crankshafts or left the rails, at which aeroplane wing-flutter became destructive, at which expensive 6-cylinder motor car engines made the owner wish that he had been content with a single-cylinder engine, were always impressing on the mechanical engineer the fact that his universal panacea of making the working parts stronger, and incidentally heavier, was not so effective as it was customary to believe.

Periodic vibrations have been almost as potent a cause of deaths and ruined reputations as for instance the Boer War.

The Strength of Shafts in Vibration by J. Morris makes an exhaustive examination of the subject at "the present state of the art." The author points out the defects in the theories of Chree and Dunkerly which he used as the basis of R & M No. 551 (1918) and follows step by step to a more rational solution of the problems

The book is a purely mathematical examination of various general cases, followed by a more particular presentation of airscrew drive, geared, and direct drive, with various arrangements of cylinders. Many combinations of engines and airscrews for power plants with more than one engine are described.

There are a few practical examples worked out and there are tables of deflection coefficients.

The quotation: "It should be made quite clear that the method outlined above for obtaining the equivalent system is entirely empirical, and the only justification for its use is its reasonable agreement with observed results in the cases known to the author"—shows that the factor of personal judgment has not been eliminated from the equation.

This work will help the designers of all high-speed engines to keep the speeds at which periodic vibration occurs outside the range of revolutions over which the engine is intended to be used, whether aircraft, motor car, or marine.—L. H. F.

HYDRODYNAMICS.

[*Leçons sur l'Hydrodynamique,* par Henri Villat. Correspondant de l'Académie des Sciences, Professeur à la Faculté des Sciences de Paris. Published by Gauthier-Villars et Cie. 55, Quai des Grands-Augustins, Paris. 50 francs. To be got, to order, from The Aeroplane Book Dept., Cannon House, Pilgrim Street, E.C.4.]

Mathematical determination of the motion of a body through fluids is complex, and in a measure unsatisfactory. The mathematically perfect fluid is a material which Nature has not supplied for the use of man, and just so far as the perfect fluid is modified to approach to reality so does the difficulty of the mathematician increase.

The author has collected together the substance of lectures given by him at the Sorbonne in 1925 and 1926 when he held the "Chaire de Mécanique des Fluides."

The object of the work is expressed in the preface, which says that:—

Notre but a été d'exposer des théories dues, soit à divers auteurs, soit à nous-même, d'une façon aussi claire que possible pour un lecteur possédant les ressources mathématiques usuelles, mais non forcément renseigné à fond sur les questions spéciales.

The author accomplishes this object, giving the present position of Hydrodynamics as presented by the writings and lectures of MM. Cisotti, Thiry, Bénard-Karman, Toussaint, and Carafoli. He deals at length with the work of M. C. W. Oseen and his pupils, and shows that although the later methods of dealing with the problems of hydrodynamics approach more closely to observed facts, there is still a considerable discrepancy.

The book should be of interest to those who study the mathematics of fluid motion.—L. H. F.

WIND DIRECTION.—An aeroplane determining the direction of the wind from an Armour smoke cylinder, which it has previously dropped, before attempting to land.

A WIND-DIRECTION INDICATOR.

The Armour Wind-Direction Indicator which has been developed by Flg. Off. J. G. D. Armour, R.A.F., of the Central Flying School, Wittering, is of great practical value, and should be widely adopted when it becomes known.

As its title implies, the purpose of the invention is to give instant and ample indication of the wind direction and approximate strength. Anyone with only very small experience of cross-country flying knows the difficulty of finding the exact direction of the wind in making a forced landing in fog or gathering darkness, or in taking refuge from the weather or to inquire one's whereabouts. The Armour indicator lessens the danger to a very large extent by giving the nature of the wind when other or natural signs are invisible.

The necessary apparatus is simple and compact. It consists of a magazine and a toggle-operated release control. The magazine normally holds six glass cylinders each containing a chemical compound which when in contact with air gives off thick white vapour like smoke. These cylinders when dropped from an aeroplane break and the resultant plume of vapour indicates the direction and strength of the wind on the ground just where the landing is to be made.

The contents of the cylinders are completely non-incendiary and they can be dropped without any harm on haystacks, standing corn or dry grass.

The magazine is a tinned-steel rectangular box, measuring 7½ in. long x 5 in. deep and 1½ in. wide. The top is a hinged lid, which, when closed, is hermetically sealed. The reason for this is that should any of the smoke cylinders break when in the container—an almost impossible contingency—no smoke can enter the cockpit and affect the pilot. As a matter of fact, Mr. Armour has demonstrated by throwing a cylinder about on the aerodrome that ordinary knocks, short of a drop from an aeroplane, will not break the cylinders.

The base of the magazine is a semi-tubular shutter pivoted at its ends and operated by a toothed pulley connected by Bowden control to the pilot's cockpit. The cylinders rest one upon the other above this shuuter when it is closed. To release a cylinder the toggle on the instrument board is pulled, which rotates the shutter through 180 degrees. This releases one cylinder only, as the next one is held in check by the rising edge of the shutter, ready to fall into place when the shutter is returned to position by a return spring.

On the ends of the magazine are strips of cork, notched at intervals equal to the diameter of the cylinders to keep them in parallel should vibration tend to dislodge them, and a flat spring at the top of the container keeps the cylinders steady.

After considerable trial the best disposition for the magazine has been found—in the Moth—to be in the map-case, where it still leaves plenty of room for maps and is handy for reloading. A slot is then made through the floor through which the cylinders are discharged.

Two other indicators are being developed. One will be for the purpose of finding wind direction over water and the other will be for use over snow-covered country. This latter will produce coloured smoke.

Refills are supplied in half-dozens in circular containers, which have sorbo end packings and a sorbo diaphragm with one hole in the middle and five holes radially, so that the cylinders cannot possibly knock together.

The marketing of the apparatus has been taken over by Smiths Aircraft Instruments, of 185, Great Portland Street, London, W.1, to whom application should be made for further particulars.

508.

The components of the Armour Wind Director Indicator. The magazine is stowed low-down in the cockpit with an aperture in the floor and the release is located on the dashboard.

FOKKER AIRCRAFT IN BELGIUM.

The Société Anonyme Belge d'Exploitation de la Navigation Aérienne (Sabena) has adopted the Fokker FVII-3m monoplane (three Sabca-built 230 h.p. Titan engines) as the equipment for its air lines in Europe and the Belgian Congo to replace the Handley Page W8F three-engined biplanes which have been in use for several years.

The licence for the construction of this type was acquired by the *Société Anonyme Belges de Constructions Aéronautiques* (Sabca) from the Fokker company in January 1929 and a number have already been delivered to the Sabena company.

Yes! PALMER

AIRCRAFT BRAKES

Are suitable for all types of machines

The extreme lightness of PALMER AIRCRAFT BRAKES brings the advantages of perfect braking into the realm of practical policy for all aeroplanes. The main principle of applying brake blocks to the wheel drum, by the inflation of an annular tube, is adhered to in every case; with adaptations for different needs, as follows:

Palmer Cord Air Cylinder.

This is a flexible rubber cylinder reinforced with the famous Palmer Cord so that it has an ample margin of strength, although merely a fraction of the weight of a steel cylinder. It is designed for use on large machines not already fitted with air compressors.

Foot-Operated Relay Valve.

The air is transmitted from the cylinder or compressor to the brake tube, by way of this valve, the action of which enables the pilot to feel and control the operation of the brake by means of the pedal. No appreciable effort is called for to accomplish this.

Air Plunger for Small Planes.

No cylinder or relay valve is necessary for use on small planes. The air pressure needed for even a very considerable brake effect is so small that it can be provided by a foot-operated plunger acting direct on the air tube.

Whatever your machine, see that it is fitted with PALMER AIRCRAFT BRAKES.

PALMER AIRCRAFT BRAKES ARE A BRITISH INVENTION OF BRITISH MANUFACTURE. ASK FOR THE PALMER BRAKE BOOK, POST FREE.

THE LIGHT AEROPLANE
AND THE FLYING CLUBS.

A SPORTING EFFORT.

At 03.00 hrs. on Dec. 20 Mr. F. C. Chichester took off from Croydon in a Gipsy-Moth, G-AAKK, with the intention of flying to Australia. Although the De Havilland Company had an idea that he might try to fly to Australia, Mr. Chichester kept all his plans so quiet, and so avoided publicity, that the makers of the machine and engine did not even know what day he intended to start or whether he seriously contemplated flying to Australia.

This modesty naturally gives one confidence in his ability. For all the history of aviation teaches us that those aviators who talk most about what they are going to do achieve the least success.—Which applies equally well to other lines of business.

Mr. Chichester is a remarkable personality. He is a New Zealander by birth, and, at the age of 34 and unmarried, he is a director of five quite important companies in New Zealand, from which he seems to have amassed considerable wealth. He learned to fly at the Brooklands School of Flying three months ago and on qualifying for his A certificate, bought his own Gipsy-Moth.

Thereafter he went for a tour round Europe with complete success, and nobody ever heard anything about it. Altogether he has done about 200 hours' flying in three months.

In spite of having made no announcement about his intentions the fact that his particular Moth carries 59 gallons of petrol, which is enough for 10 or 11 hours' flying and a range of about 1,000 miles, seems to indicate that he is out to do the journey in long hops. The only thing that is known about his intentions is that he has made arrangements with the Shell Company for dumps of petrol and oil at certain specific places.

THE SINGAPORE FLYING CLUB.

The total flying time for October was 98 hrs. 30 mins. which is a record for the Club. This is very satisfactory when one considers that the weather was by no means perfect and that for many days only one machine was available. Most of the time was put in on five Sundays and holidays when the machines were only on the water for changing pilots and pupils and re-fuelling.

On Oct. 11 the engines in both serviceable machines "passed out," one in the air at 07.30 hrs. and the other at 18.00 hrs. Both engines had to be taken out and new ones put in. Both machines were flying again on the next day, one at 14.00 hrs. and the other at 17.00 hrs.,—evidence of the keenness and hard work of the ground staff in general and of the Ground Engineer, Mr. M. G. Harvey, in particular.

MORE MOTHS FOR CHINA.

The De Havilland Aircraft Co. Ltd. has received a further order for eight Gipsy-Moths for China. These are to be provided with interchangeable float and wheel undercarriages.

This brings the total number of Moths supplied to China up to 35, of which 31 have been supplied this year.

OVER THE COUNTER.

To be thoroughly up to date in their Christmas present trade the Army and Navy Co-operative Society, Ltd., wished to include a complete Gipsy-Moth in their Christmas display in their main premises in Victoria Street, S.W. Although the Society are not regular agents of the De Havilland Company, the firm loaned them a Gipsy-Moth "on sale or return."

Hardly had the Moth been delivered and placed in the showrooms than it caught the eye of Sir Hugh Clifford, G.C.M.G., G.B.E., Governor of the Straits Settlements and High Commissioner for the Malay States. Sir Hugh at once made himself a present of it, and also made arrangements with the De Havilland School of Flying for a course of flying instruction.

The Army and Navy Co-operative Society, Ltd., have been supplied with a second machine, also "on sale or return."

A TRIBUTE FROM THE STATES.

The following is an extract from a letter received by The Moth Aircraft Corporation, of Lowell, Mass., the American licensees for the D.H. Gipsy-Moth, from Skyways Incorporated, of East Boston, Mass.:—

We have just finished our first year of using Moths for instruction, and we were very agreeably surprised to find out how much we have accomplished in that time. We acquired our first Moth imported in April, and since then we have, as you know, taken four domestic (American-built) ships, the last two in September. Since April, we have "soloed" fifty-three students in Moths and have flown them eleven hundred and ninety-three hours.

We have at periods of extreme activity repeatedly flown these ships over eight hours in a day, which has been virtually impossible with any other equipment we have used heretofore.

During this time only one student has been hurt and his injury consisted of a swollen lip, obtained when he hit a fence, landing. The Moth, which landed on its back from a height of perhaps five feet, required only replacement of shock strut, prop, rudder and centre section struts. We feel that these facts should be of interest to those who think that the Moth because of its excellent performance must be too light to stand the strain of student flying.

"THE D.H. GAZETTE."

The Editor of *The D.H. Gazette* has received several inquiries as to whether facilities exist for the binding of Volume I, comprising Nos. 1—15 inclusive. Quotations have been obtained which show a wide divergence in price according to the number of sets to be bound.

It is requested therefore that those readers who retain complete sets and who would like to have them bound communicate with the Editor, c/o The De Havilland Aircraft Co. Ltd., Stag Lane Aerodrome, Edgware, Middlesex, who will get a quotation based on the number of replies received.

The Editor of *The D.H. Gazette* complains that a large quantity of the last issue has been returned to him owing to the addresses on the mailing list being out-of-date. If those people who have left their old addresses and are still interested to receive the *Gazette* will let the Editor have their new addresses he will be pleased to have the necessary alterations made to the mailing list.

GIPSY-ENGINED.—The Albatros L-82 two-seat light biplane which has a 90/100 h.p. D.H. Gipsy engine, welded steel tube fuselage and folding wings.

TWO DECEMBER CAMEOS.

By Rodney Holt.

A glance at my wrist warns me that it is close upon five o'clock and, frowning, I attack the mass of papers on my desk with greater determination.

"George," I say to my assistant, "if Browns send in their new order whilst I am away, see that . . . . etc., etc."

The last documents are sorted. My junior and I have discussed every point that is likely to rise during the next fortnight. Trade, as a rule, is very quiet for a week or two after Christmas but I have told him that if anything important occurs he must wire immediately for me to return. I reach for my hat.

"Good-bye, sir," says George. "Hope you have a good time."

"It depends upon the weather," I reply. "A wet holiday in the country isn't too thrilling, you know."

An hour later—in the train—I am wondering whether I explained to George what to do if So-and-So write . . . . .

. . . . . .

Substitute "leave" for "holiday," 07.00 hrs. for 5.0 p.m. and 1917 for this present year of grace. One page of my diary, I see, contains the simple, almost prosaic entry, "Went on leave." And the memory of that long-past December morning comes back to me vividly as I read the words.

"Wake up, my lad. Early patrol for 'B' Flight."

I opened my eyes and regarded the speaker with extreme disfavour. He repeated the remark in a more urgent tone, tearing the blankets, at the same moment, from my recumbent form. Then I remembered . . . .

"Damn you," I said, "*and* your patrol! I'm going on *leave* to-day."

And I sat up in bed, dreamily contemplating this delightful fact. The menacing rumble of guns in the distance, which informed me that the war was proceeding with its usual vigour, appeared singularly unalarming to-day. The war, I reflected contentedly, did not interest me in the least—not for the next fourteen days, at any rate.

My companion was insinuating himself, with many grunts, into a Sidcot suit. "It would be very amusing," he observed, "if you went on patrol as usual and, with a Hun jammed nicely on your tail, realised suddenly that you ought to have gone home on leave!"

"Most laughable," I agreed politely.

Still chuckling at the idea, he ambled towards the door, pausing only to fire a final shot.

"Not that you're any use to the Flight," he assured me. "For the last week you've been too ruddy scared of breaking your neck and missing your leave!"

There was, unfortunately, a certain measure of truth in this taunt. My interest in aerial warfare during the past week had been, if anything, a little tepid,—for my great ambition had been to find myself alive on this, the seventh morning. And my young life had contained no sweeter moment than yesterday when, after my last show, I had switched off the engine, flung my helmet and gloves into a corner and proceeded to the Mess to drink my own surprisingly good health.

Presently, shaved, dressed and breakfasted, my bag deposited in the tender which was to take me to Boulogne, I strolled onto the aerodrome to see "B" Flight start.

Already the machines, looking like some queer gigantic beasts in the half light, had been wheeled from the hangars. A dank chill hung over the ground. The pilots were standing in a little depressed group by the hangar doors, polishing goggles and adjusting their helmets. They eyed my radiant going-on-leave apparel disapprovingly.

"What a pretty boy!" This was my room-mate and critic of my recent flying activities.

"I'm glad you think so," I returned. "I have taken special pains with my toilet this morning. I hope you boys will think of me—just about arriving in London—when you are coming back from your afternoon show. What about the long bar of the Troc.? And the Alhambra to-night? And," I added, feelingly, "not having to fly an aeroplane over the adjectival lines for two weeks?"

"Come on, chaps," growled the Flight Commander. "This bloke makes me feel sick with his yapping! He ought to stay and win the war with *us* instead of sneaking off!"

"Well, so long," and he wrung my hand warmly. "Sha'n't see you for some time. I'm off myself in a fortnight."

"I know," I said.—What I did not know then was that, within one short hour, the machine into which he was climbing would be lying, a blazing wreck, ten miles east of our lines.

The roar of six Hispanos now filled the air. The leader waved away the chocks, grinned a cheery farewell to me and opened the throttle. One by one "B" Flight took the air. A minute later they were heading in formation, for the lines. Yesterday one of those six Hispanos had *my* hand on its throttle,—and a fortnight hence—but never mind that now.

The machines were mere specks in the sky as I stepped into the waiting tender. The driver let in the clutch with a jerk . . . . Behind me lay the war, offensive patrols, Huns, "archie," fire and sudden death; and ahead lay—home, London, leave, *leave*, LEAVE . . . .

. . . . . .

"Hope you have a good time," says George.

"It depends upon the weather," I reply.

THE CHRONICLES OF R.100.

On Dec. 17 the R.100 went for her second flight and was in the air for about six hours. During the first flight of the airship from Howden to Cardington a certain lack of tautness in the fabric was noticed round the lower fin.

On this second trip special observations were made to secure data about this looseness. During this trip part of the fabric which seals the rudder hinge actually came adrift but was repaired in the air.

The time taken to moor the ship (32 minutes) was the fastest time yet recorded for this operation.

On Dec. 18 the airship was removed from the mooring mast to the second shed, where the tautness of the covering will be adjusted.

One imagines that the kennelling of these greyhounds of the air will allow everyone to spend a happy Christmas far from the cares and worries of the mast-head.

NEWSPAPER INACCURACIES.

Paragraphs, amounting in fact to quite important articles have appeared in Sunday newspapers recently making a great fuss because according to the stories, Herr Walter Kleffel, formerly a pilot in the German Flying Corps during the War 1914-18, having been invited to a gathering of R.N.A.S. and R.F.C. pilots in Manchester, refused the invitation and thereafter disappeared. According to some of these stories he was described as the navigator of the *Graf Zeppelin* in its trans-Atlantic voyages, and as a German War Ace, and as being the representative of the German Government here for the purpose of inspecting and watching the progress of R.100 and R.101, and a variety of other things which he is not and never has been.

As a matter of fact Herr Walter Kleffel is the aeronautical correspondent of the *B.Z. am Mittag*, or "Berlin Mid-day Times." He was a pilot during the War, and he is one of the best sportsmen one has met for a very long time.

He became a friend of everybody in the office of The Aeroplane several years ago when he paid his first visit to England to see the R.A.F. Pageant at Hendon. Since then he has been about this country quite a good deal, and everywhere he has been both popular and amusing. He is always full of enthusiasm, a very lively companion, and unlike most journalists, he knows what he is talking about.

He was a passenger in the *Graf Zeppelin* across the Atlantic and back. He has as many friends in the States as he has in England and he has a vast store of knowledge about aeronautical affairs in all countries. But he never has been a Zeppelin navigator and he is in no way a representative of the Government, beyond the fact that probably if he sees anything interesting he reports it to his Government just as if one were in a foreign country and saw something interesting, one would report it to the Air Ministry.

The last thing he would do would be to refuse on any grounds a chance of a friendly meeting with the men whom he may have fought during the War. The whole yarn as it appears in the papers is sheer nonsense. Either some Manchester humorist has been pulling the leg of the press or some incompetent journalist has got hold of the wrong end of the story, or the whole thing is a pure misunderstanding. Whatever may be the facts Herr Walter Kleffel is assured of as hearty a welcome as ever when he again visits England. When the story appeared he was in fact in Berlin and then heard for the first time that he had been invited to a party of which he had never heard.—C. G. G.

Marconi Equipment for Air Ports

Quick and reliable communication with aircraft and other aerodromes is the keystone of efficiency of air ports and aerodromes. Marconi wireless telephone and telegraph transmitters are specially designed as ground stations for air services. These transmitters are built in various sizes and powers to meet the individual requirements of any air port and to provide the maximum efficiency in communication. Their design is based on world-wide experience in fulfilling the requirements of air services.

COMMERCIAL AERONAUTICS.

THE DANGERS OF THE BLIND SPOT.

[This article, by a war-time pilot who has recently taken flying again, deserves the attention of all designers,—as ell as users. Personally one goes further than does the riter, and if one were a betting man one would lay good oney that within fifteen years (that is to say five years hus the usual delay of the English mind) single-engined ractor biplanes and high-wing monoplanes will be illegal, ecause of the danger to other air users, and tractor crews will have vanished from up-to-date design, because f their inefficiency and noise. Full visibility will then be requirement for an airworthiness certificate.—C. G. G.]

Unless designers of aircraft seriously consider the problem of the view which they give to the pilot of an aeroplane, both when in the air and on the ground, the number of major and minor accidents is going to increase alarmingly as flying becomes more popular.

Already at aerodromes where many aircraft are flying at the same time, the risk of collisions has become serious, and stringent rules have to be made about direction of circuits, and turning near the aerodrome. But as the number of aircraft increases, the only solution of the problem seems to be to give the pilot a better view.

A motor-car would be quite a difficult vehicle to drive if it had an opaque wind-screen and the driver had to put his head through the window of a side-screen to see where he was going. Yet this is the sort of thing a pilot has to do with nearly all types of aircraft.

Because an aeroplane moves in three dimensions a pilot really needs to be able to have a hundred per cent. view in all directions. This is obviously impossible, for the fuselage and wings (unless they be made of an invisible substance, such as the mythical "Plass") must obscure part of the view.

There are three general lay-outs at present used for standard aeroplanes. These are the narrow-chord biplane, the high-wing monoplane and the low-wing monoplane.

The narrow-chord biplane, the best-known example of which is the Moth, has, as its most ardent supporters will be the first to admit, certain blind spots. It is true that as one gets to know a Moth better and learns how and where to look out of it so the view seems to improve, just as one gets accustomed to driving a saloon car. Nevertheless there are bad blind spots that can only be got rid of by radical alteration of design.

The first of these is caused by the engine in the nose. This, one is told, has been immensely improved by fitting an inverted Gipsy engine, thus allowing the fuselage to follow its natural lines to the nose. This particular blind spot is chiefly objectionable when taking off, alighting, taxying, and to a certain extent when flying across country by landmarks in bad weather.

The second is caused by the upper wing and prevents one from seeing upwards and ahead in quite a large area. It is in this obstruction that, in one's own opinion, the chief danger of collision lies.

The lower wing certainly hides an even bigger portion of the view than does the upper, but with a narrow fuselage one can see pretty well what is going on below, and the onus of seeing where he or she is going should be on the pilot of a lower machine who should have a clear view forward and above. [Which is very little consolation when one has been hit at 500 ft. or so, by someone who has a bad blind spot.—C. G. G.]

The view obscured by the fuselage and tail below and behind is immaterial in these days of peace when hardly anyone even knows the meaning of the letters E.A.

The high-wing monoplane is very little better than the biplane in most cases and in some cases it is much worse, because of the bigger chord and span. In the other examples, such as the Hawk Moth and the Desoutter, the pilot sits just behind the leading edge of the plane. Thus one gets a good view upward and forward, both in the air and on the ground.

The view immediately upward and behind, which is very desirable when gliding in to land, and is essential before taking off, is practically nil.

It is true that the Hawk Moth has a glass top to the cabin but this is liable to be obscured by oil. In the Desoutter the passenger can see out behind and above through windows, but passengers are not always carried or reliable.

Another disadvantage of the high-wing monoplane is that in turning in to land and in side-slipping the wing that is down obscures the landing area.

The low-wing monoplane on the whole seems to be the best solution of the problem, particularly if it is fitted with an inverted engine such as the Gipsy. Here the pilot has a wonderful view forward and upward and can see behind him when about to take off or when gliding in to alight.

If every machine in the air were a low-wing monoplane it would be difficult for one of the pilots of two machines not to see the other, whereas in the biplane or the high-wing monoplane the pilots of either type could each be in both their own and the other pilots' blind spot at the same time.

The only objections to the low-wing monoplane which one has so far heard are (1) that its construction is heavier than that of the biplane or the high-wing monoplane, both of which can be braced whereas the low-wing job must be a cantilever, and (ii) that it is difficult to make it fold.

Some of the new types of wing such as the Stieger-Haig Monospar system will, one is assured, sweep away these difficulties and it would be interesting to hear any arguments to the contrary.

One realises that the low-wing monoplane can only be immune from collision in the air or on the ground when all machines are of that type. And it is of course unreasonable to expect the hundreds of biplanes and high-wing monoplanes to disappear at once. But for the safety of the air, and, therefore, for its prosperity, this state of affairs is bound to come sooner or later.

When one gets to bigger craft such as Argosies or the big flying-boats, the pilot can be placed right in the nose of the machine, yards ahead of the wings, where he gets a good view anyway, but for the smaller types the low-wing monoplane appears to be the Only Way.—G. D.

THE SPOONER CELEBRATIONS.

The Royal Aeronautical Society states that the dinner to Mr. Stanley Spooner, to celebrate the twenty-first anniversary of the foundation of *Flight*, will be held on Jan. 3 at the Savoy. Tickets will cost about 16s. each, exclusive of wines. All those who wish to attend are asked to communicate at once with the Secretary, The Royal Aeronautical Society, 7, Albemarle Street, W.1.

OVERCOMING OBSTACLES.

The following letter will, one hopes, be some encouragement to the weaker brethren:—

Sir,—May I congratulate you on the leading article in this week's AEROPLANE "On Getting Over Obstacles"?

I thoroughly agree with your contention that officials at the Air Ministry are now fixing arbitrary limits for Civil Passenger Aircraft without the determining factor being the use to which the particular aircraft is to be put. If the aircraft cannot come up to these arbitrary limits it is to be denied the necessary certificate of airworthiness to allow it to operate in this country or to be exported. And as you say, no customer abroad will buy a British machine without its certificate of airworthiness.

I have discussed this matter with one or two officials in the Air Ministry quite recently, and I believe that the arbitrary limits are based on some agreement arrived at by some International Convention which doubtless emanates from Geneva, the place apparently which is to rule the World in the future and to dictate to us, to our national detriment, the terms on which we are to conduct business. These terms usually put us at a disadvantage compared with our competitors in trade, who are also the gentlemen who sit round the table and out-vote us at regular intervals.

I sincerely hope that the Department of Civil Aviation will read, mark, learn and inwardly digest your leading article. This is a matter which I trust will be raised by some member of the House of Commons when the Air Estimates come up for discussion. Failing everyone else your inadequate and humble servant will try to take on the job with, I trust, your co-operation.

(Signed) HAROLD BALFOUR.

AMERICAN AIRCRAFT IN CHINA.

The Chance Vought Corporation recently received a rush order from the presently-effective Chinese Government for twelve Vought Corsairs. These are two-seat fighter reconnaissance biplanes (Pratt and Whitney Wasp engines).

This order includes armament and ammunition. The total value is about $1,000,000 (£200,000). Six machines have already been shipped to China.

Similar machines have already been supplied by the same firm to the Mexican, Cuban and Argentine Governments.

The only British aircraft so far sold to the *de facto* Government of China are some Avro Avians, supplied by Mr. Vaughan Fowler, of the Far East Aviation Co. Ltd. of Hong Kong,—at any rate since the various Vickers machines sold just after the War 1914-18, before the Chinese Revolution. The Americans have sold several cabin-monoplanes lately, besides other war machines.

Digitized by Google

AN AIRSHIP CHANGE.

The Airship Development Co. Ltd., of 39, Victoria Street, S.W.1, desire the fact to be known that Mr. Weir MacColl, who has been a Director of the firm and pilot of their little advertising ship at Cramlington, has resigned his position and is no longer associated with the firm.

The pilot of the A.D.1 "Blimp" is now Mr. Beckford Ball, who recently qualified for an Air Ministry "B" licence as an airship pilot. Incidentally, he seems to be the first pilot to hold a licence of this kind.

The Airship Development Co. state that their ship is now ready for commercial use for aerial advertising and photography, and for the training of airship pilots and personnel.

AMERICAN AIRCRAFT IN SOUTH AFRICA.

On Jan. 1 1930 the Travel Air Manufacturing Co. of Wichita, Kansas, will open a distributing agency in Cape Town.

Mr. Newman Wadlow, a Travel Air test pilot, has left New York for South Africa with two Travel Air aircraft, one a six-seat cabin monoplane and the other a three-seat open biplane. These machines will be demonstrated throughout the Union of South Africa.

GETTING IN TOUCH WITH THE USER.

The officials of the Black & Decker Manufacturing Co. of Towson, Maryland, U.S.A.—makers of machine tools, &c.—have visited a group of aircraft manufacturers in Wichita, Kansas, with a view to examining the requirements of the Aircraft Industry in high-speed electric tools.

Mr. Black, President of the company, has bought a six-seat Travel Air monoplane for the company's use.

The British Aircraft Industry will soon find this enterprising firm getting in touch with them likewise.

WHERE CHAMPIONS ARE MADE.

News has been received that the Canadian Factory of Champion Sparking Plug Company, of 83, Pall Mall, S.W.1, which is entirely devoted to the manufacture of sparking plugs for the British Isles, Canada, Australia, South Africa, New Zealand and India, has been doubled in size.

This has been brought about by the increasing demand for a sparking plug of high efficiency such as is made by this Company. Some idea of this demand may be gathered by the fact that the output of this factory in conjunction with the two American factories, is in excess of 1,000,000 plugs per week, and the annual production is something like 75 million.

The factory employs all British Labour and uses British material (with the exception of the Sillimanite bisque which is unobtainable in British territory).

The slogan adopted by this Company of "Champions choose CHAMPIONS" has justified itself this year, for this plug has come out top in the Grand Prix of Monza (Italy), the Ulster Tourist Trophy, the Irish International Grand Prix and the Grand Prix of Spain.

These plugs were also fitted to the Italian Macchi 52 *bis*, which finished second in the Schneider Trophy contest last September.—

L. W. N.

AS OTHERS SEE US.

A subscriber writes:—

I enclose on behalf of myself and a fellow-admirer of your works a year's subscription to THE AEROPLANE.

At the same time we would like to offer you the thanks of two dabblers in air for a great deal of pleasure and instruction which that paper has already afforded us, and our best wishes for an ever increasing public.

PERSONAL NOTICES.

DEATHS.

JENKINS.—On Dec. 17, near Tunis, in an attempt to break the World's Long Distance Record for aeroplanes, Flt. Lt. N. H. Jenkins, O.B.E., D.F.C., D.S.M., R.A.F.

Norman Hugh Jenkins was born at Southampton in 1895. He served as a rating in the Royal Naval Air Service at Eastchurch from March, 1915, until July, 1917. During this period he was awarded the Distinguished Service Medal for services on patrol duty and submarine searching in Home Waters.

In July, 1917, he was appointed temporary Sub-Lieutenant (Observer), R.N.A.S., on probation, which appointment was confirmed in November, 1917, and he was posted to No. 202 Naval Squadron at Dunkirk. In April, 1918, he was promoted Lieutenant (Observer). In June, 1918, he was wounded in action. In April, 1919, he was posted to No. 110 Squadron. In the King's Birthday Honours of 1919 he was awarded the Distinguished Flying Cross in recognition of distinguished services during the War.

In October, 1919, he was appointed to a Short Service commission in the R.A.F. as an Observer Officer and was posted to No. 24 Squadron. In June, 1922, he was promoted to Flight Lieutenant and in September, 1922, he was posted to No. 84 (Bombing) Squadron at Shaibah, 'Iraq. In August, 1923, he was given a permanent commission in the R.A.F. He was awarded the O.B.E. in June, 1925, and in November, 1925, he was posted to No. 30 Squadron, Hinaidi, 'Iraq.

In November, 1926, he was restored to the Home Establishment and posted to No. 15 Squadron, part of the Aeroplane Experimental Establishment at Martlesham Heath. In July, 1927, he was transferred to No. 22 Squadron at Martlesham Heath.

In April, 1929, he was second pilot of the Fairey Long Range Monoplane when it flew from Cranwell to Karachi, non-stop in 50 hours, 48 minutes.

Flight Lieutenant Jenkins' death is a severe loss to the Service in which he was so distinguished and courageous a pilot and so efficient an officer.—C. M. MCA.

JONES-WILLIAMS.—On Dec. 17, near Tunis, in an attempt to break the World's Long Distance Record for aeroplanes, Sq. Ldr. A. G. Jones-Williams, M.C., No. 23 (Fighter) Squadron, R.A.F.

Arthur Gordon Jones-Williams was born in Vernon, British Columbia, in 1898, and was educated at Haileybury and the R.M.C., Sandhurst. He entered The Welch Regiment in August 1916 and was seconded to the Royal Flying Corps in January 1917. He was posted to No. 29 Squadron in France and was appointed Flight Commander in May 1917.

In July 1917 he was awarded the Military Cross for conspicuous gallantry and devotion to duty. In September 1917 he was awarded a bar to the Military Cross for conspicuous gallantry. After a period of duty at home he was posted to No. 65 Squadron in France. After the Armistice he was appointed to a permanent commission in the R.A.F. with the rank of Flight Lieutenant.

In 1919 he was posted to the Flying Wing at Cranwell, and in 1922 he was appointed to Headquarters, 'Iraq, as personal assistant to the Air Officer Commanding,—this entailed being chief pilot to Sir John Salmond, with whom he flew over practically the whole of 'Iraq.

In July 1924 he was posted to No. 8 (Bombing) Squadron as second-in-command. He was restored to the Home Establishment in December 1915 and after a spell of leave was posted to No. 100 (Bombing) Squadron.

In 1927 he accompanied Sir Philip Sassoon on a tour of the American Air Stations. He also flew Sir Philip Sassoon to Venice for the Schneider Trophy Competition of 1927.

In January 1928 he was promoted to Squadron Leader and appointed to command No. 23 (Fighter) Squadron at Kenley.

In April 1929 he was pilot of the Fairey Long Range Monoplane when it flew from Cranwell to Karachi non-stop in 50 hours, 48 minutes. Only the continuous head winds and bad weather during the latter part of the flight prevented a new World's Record being made on that occasion.

Squadron Leader Jones-Williams was a very gallant officer, a fine squadron-commander and a skilful pilot. His cheery disposition endeared him to all ranks with whom he served as well as to a host of friends.—C. M. MCA.

WILLIAMS.—On Dec. 15, in Canada, as the result of an aeroplane accident, Robert Cyril Williams, sixth son of Mr. and Mrs. M. Scott Williams, Woolland House, Blandford, aged 30.

DE CRESPIGNY.—On Dec. 14, at Peshawar Hospital, Robert Vivian Champion, beloved elder son of Sq. Ldr. H. V. and Mrs. Champion de Crespigny, aged two years.
